2. Getting Started with Arduino

2.1 What is Arduino?

Arduino is an open-source electronics platform based on easy-to-use hardware and software. Arduino boards are able to read inputs - light on a sensor, a finger on a button, or a Twitter message - and turn it into an output - activating a motor, turning on an LED, publishing something online. You can tell your board what to do by writing the program code in the IDE and sending the instructions to the microcontroller on the board. To do so you use the Arduino programming language (based on Wiring), and the Arduino Software (IDE), based on Processing.

2.2 Installing the Arduino IDE for Windows

1. Visit <https://www.arduino.cc/en/software> to download the latest Arduino IDE version for your computer's operating system. There are versions for Windows, Mac, and Linux systems.

The Arduino IDE 2

The Arduino IDE 2 is a big step from its sturdy predecessor, Arduino IDE 1.x, and comes with revamped UI, improved board & library manager, debugger, autocomplete feature and much more. Here we will show how to download and install the Arduino IDE 2.2.1 on your Windows. You can choose between the Installer (.exe) and the Zip packages. We suggest you use the first one that installs directly everything you need to use the Arduino Software (IDE), including the drivers. With the Zip package you need to install the drivers manually. The Zip file is also useful if you want to create a portable installation.

1. Select Win 10 and newer, 64 bits in DOWNLOAD OPTIONS.

The screenshot shows the Arduino website at arduino.cc/en/software. The 'SOFTWARE' tab is selected. On the left, there's a section for 'Arduino Web Editor' with a 'CODE ONLINE' button and a 'GETTING STARTED' link. On the right, there are two sections for 'Over-the-Air Updates' with 'DISCOVER MORE' links. Below these, a large red arrow points to the 'DOWNLOAD OPTIONS' section on the right. This section contains links for Windows (Win 10 and newer, 64 bits), Windows MSI installer, Windows ZIP file, Linux AppImage 64 bits (X86-64), Linux ZIP file 64 bits (X86-64), macOS Intel, 10.14: "Mojave" or newer, 64 bits, and macOS Apple Silicon, 11: "Big Sur" or newer, 64 bits. A red box highlights the 'Windows Win 10 and newer, 64 bits' link.

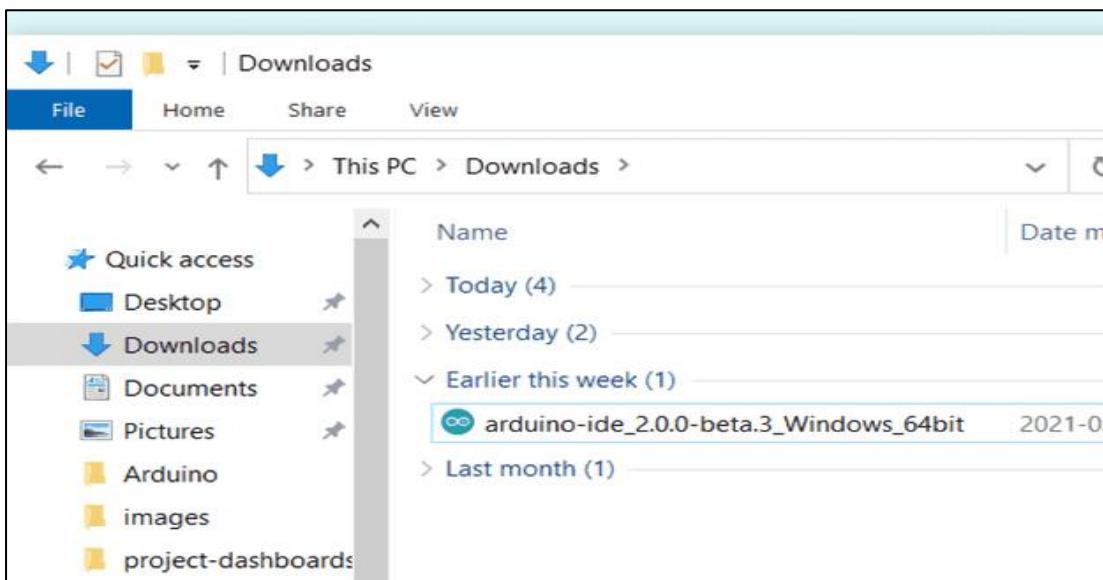

2. Click JUST DOWNLOAD

The screenshot shows the Arduino website at arduino.cc/en/donate/. The 'SOFTWARE' tab is selected. The main content area says 'Download Arduino IDE & support its progress' and notes that since March 2015, the Arduino IDE has been downloaded 77,971,368 times. Below this are buttons for '\$3', '\$5', '\$10', '\$25', '\$50', and 'Other'. A red arrow points to the 'JUST DOWNLOAD' button, which is highlighted with a red box.

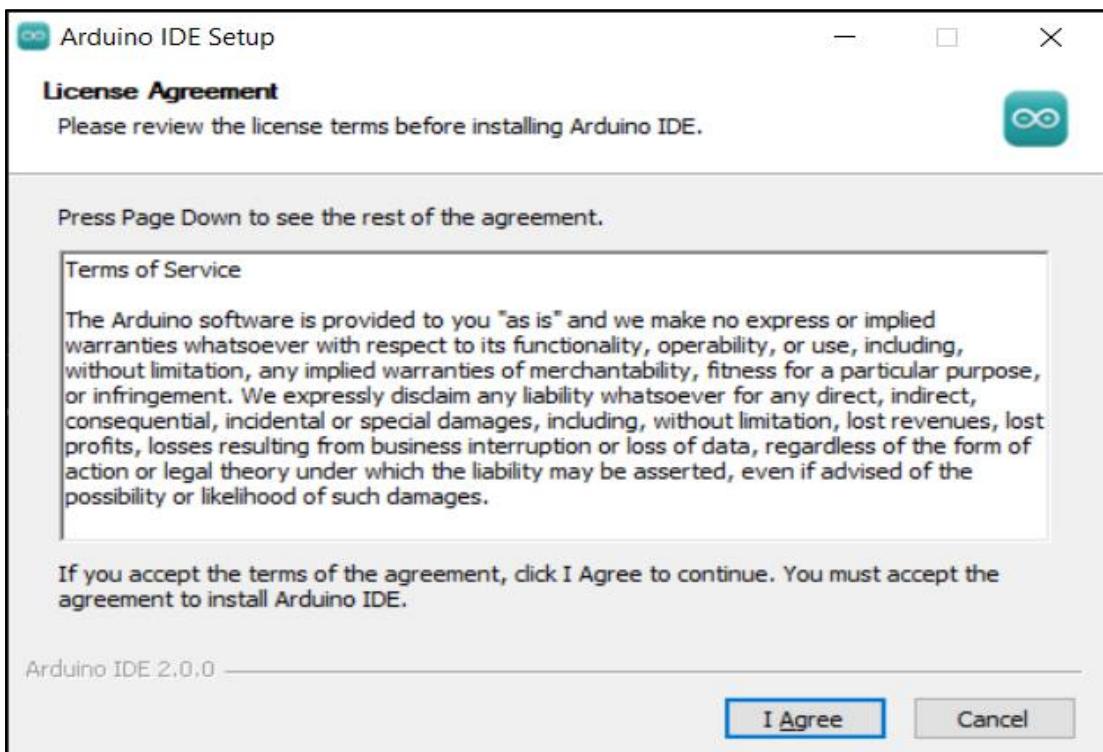

3. Join Newsletter or you can just Click JUST DOWNLOAD

The screenshot shows the Arduino website at arduino.cc/en/donate/newsletter. The 'SOFTWARE' tab is selected. The main content area says 'Stay in the Loop: Join Our Newsletter!' and explains that as a beginner or advanced user, you can find inspiring projects and learn about cutting-edge Arduino products through their weekly newsletter. There is a text input field for 'email *' and two checkboxes: one for accepting the Privacy Policy and Terms of Service, and another for receiving commercial offers. Below these is a 'SUBSCRIBE & DOWNLOAD' button. A red arrow points to the 'JUST DOWNLOAD' button, which is highlighted with a red box.

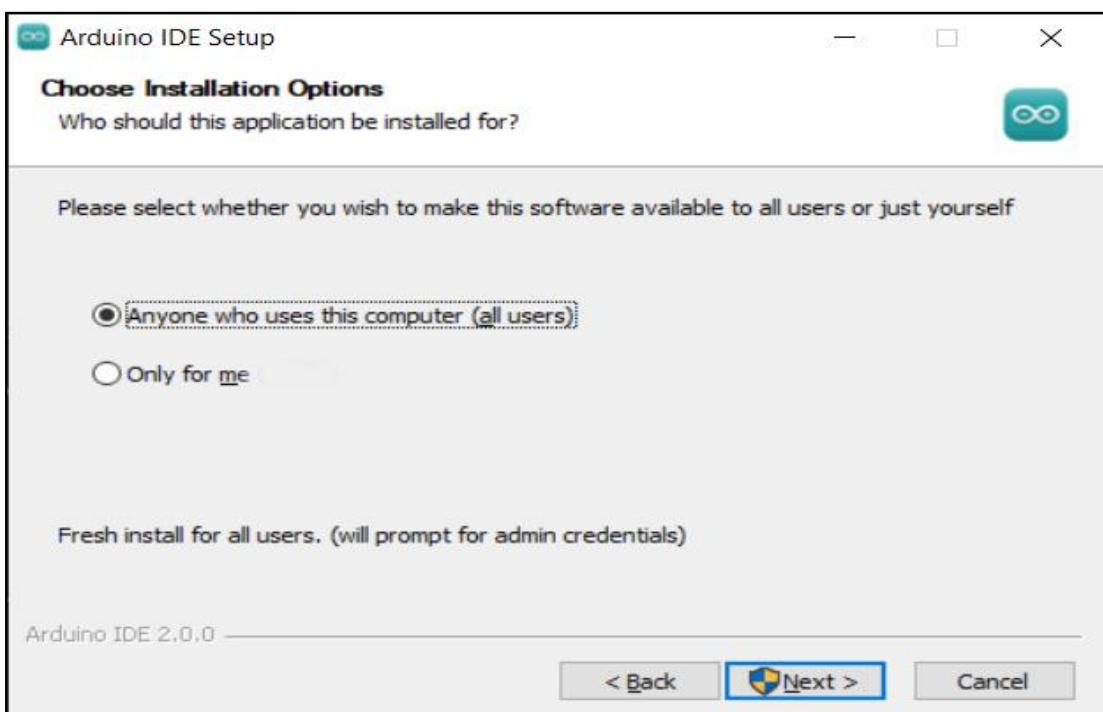

4. Save the .exe file downloaded from the software page to your hard drive and simply run the file .

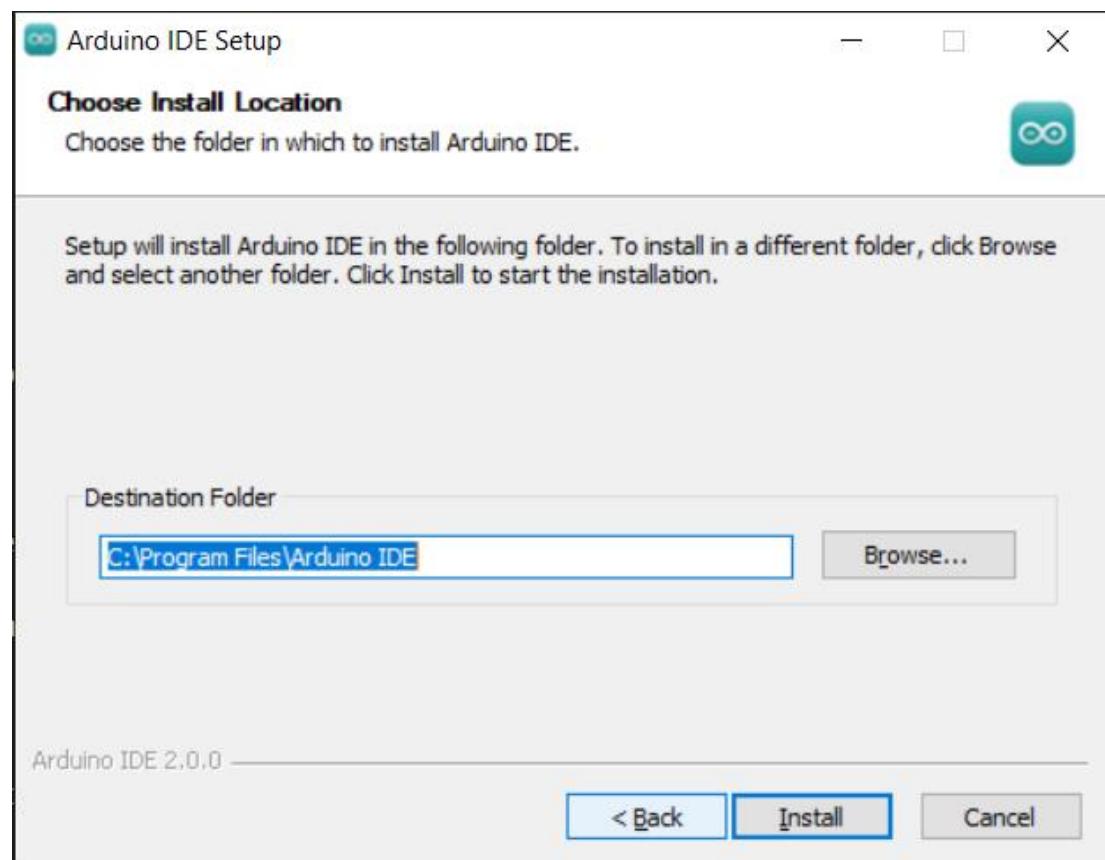

5. Read the License Agreement and agree it.

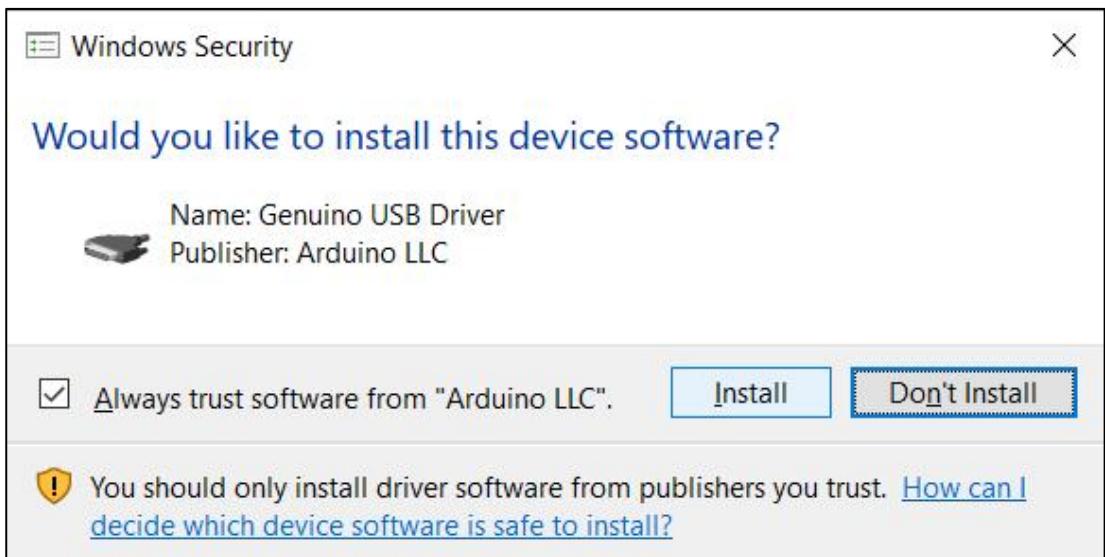

6. Choose the installation options.

7. Choose the install location.

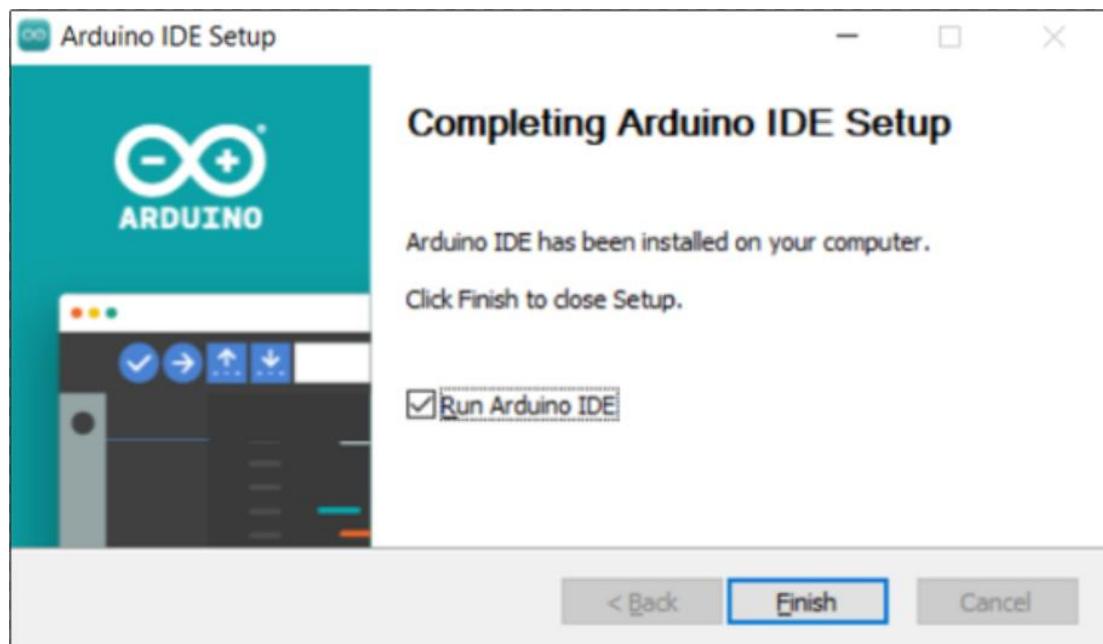

8. In addition, the security center may pop up a few times asking you if you want to install some device driver. Please **install** all of them.

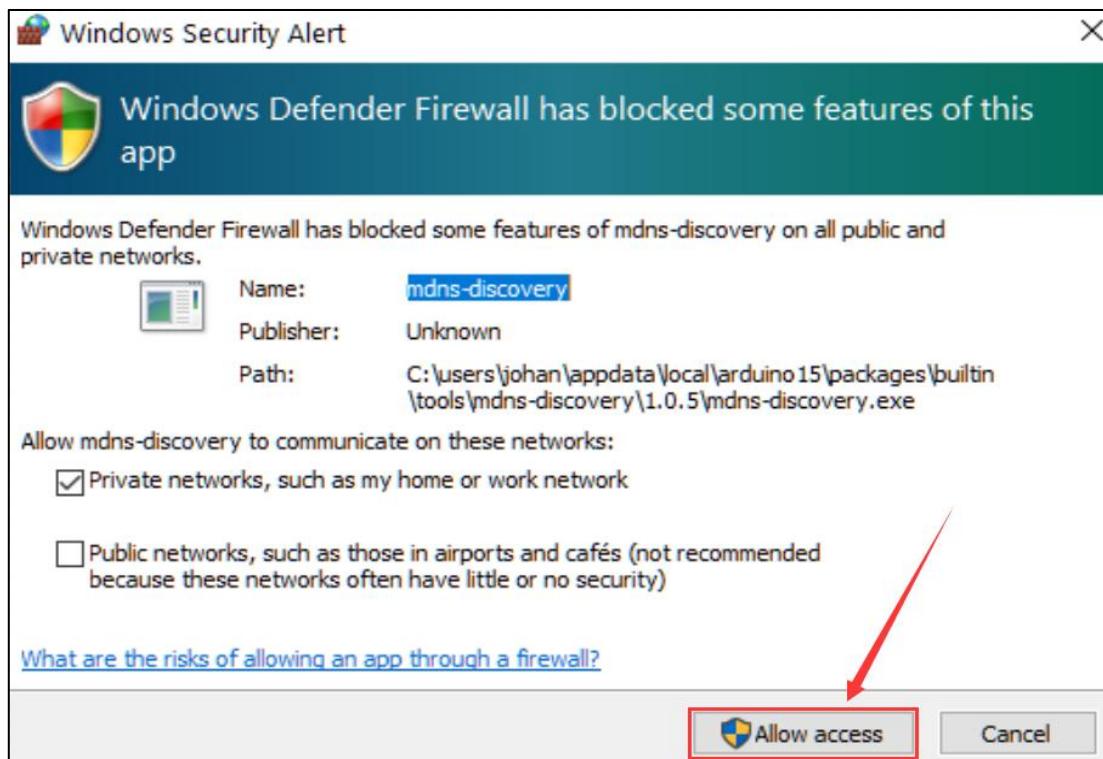

9. Click finish and

run Arduino IDE

10. Firewall will ask whether we'd like to give allow access, just simply click on **Allow access**.

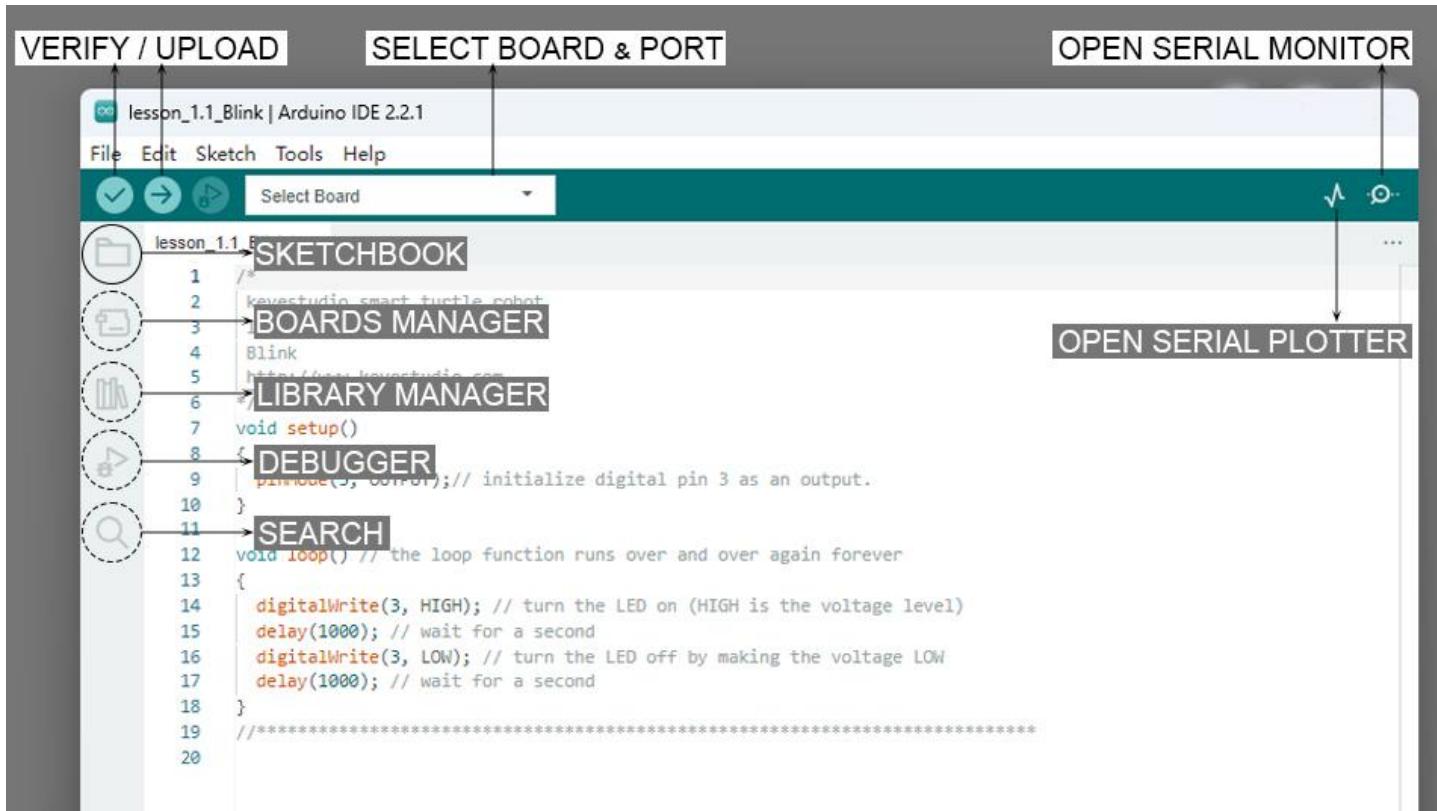

11. Wait for some time to allow arduino IDE to automatically install the Arduino AVR Boards, built-in libraries, and other required files.

A screenshot of the Arduino IDE Output window. It displays the following log output related to package installations:

```
Output
Downloading packages
arduino:avr-gcc@7.3.0-atmel3.6.1-arduino7
arduino:avrdude@6.3.0-arduino17
arduino:arduinoOTA@1.3.0
arduino:avr@1.8.6
Installing arduino:avr-gcc@7.3.0-atmel3.6.1-arduino7
arduino:avr-gcc@7.3.0-atmel3.6.1-arduino7 installed
Installing arduino:avrdude@6.3.0-arduino17
arduino:avrdude@6.3.0-arduino17 installed
Installing arduino:arduinoOTA@1.3.0
```

Arduino IDE 2.0

Verify / Upload - compile and upload your code to your Arduino Board.

Select Board & Port - detected Arduino boards automatically show up here, along with the port number.

Sketchbook - here you will find all of your sketches locally stored on your computer. Additionally, you can sync with the Arduino Cloud, and also obtain your sketches from the online environment.

Boards Manager - browse through Arduino & third party packages that can be installed. For example, using a MKR WiFi 1010 board requires the Arduino SAMD Boards package installed.

Library Manager - browse through thousands of Arduino libraries, made by Arduino & its community.

Debugger - test and debug programs in real time.

Search - search for keywords in your code.

Open Serial Monitor - opens the Serial Monitor tool, as a new tab in the console.

If you want to learn more about Arduino IDE, please refer to this document: [Getting Started with Arduino IDE 2](#)

2.3 Introduce of Keyestudio UNO Board

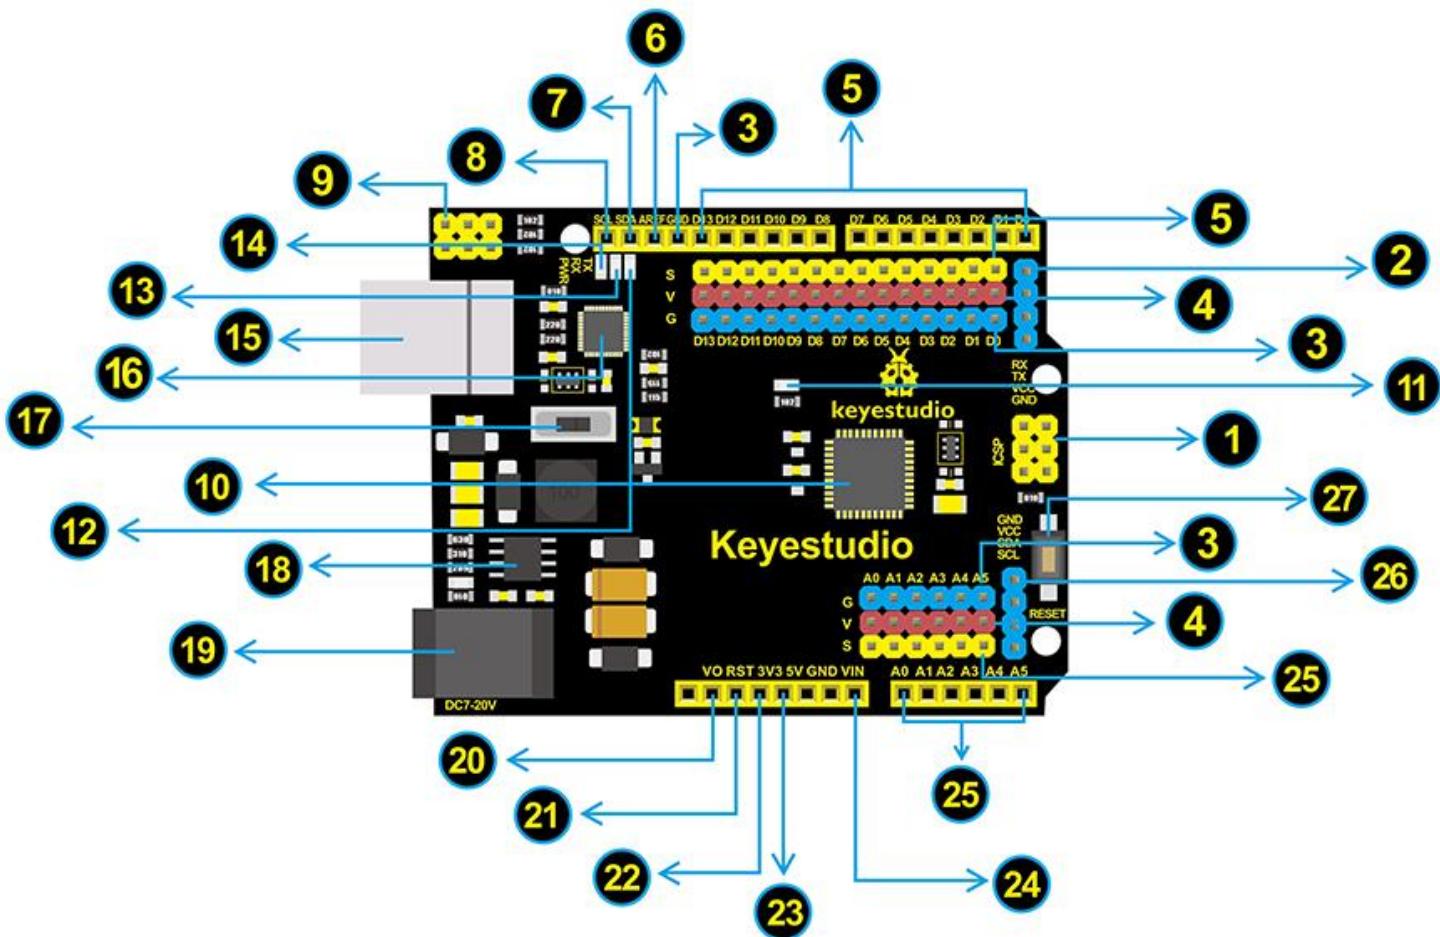

The core processor of this board is ATMEGA328P-AU and ATMEGA16U2 is used as a UART-to-USB conversion chip.

It has 14 digital input/output pins (of which 6 can be used as PWM outputs), 6 analog inputs, a 16 MHz crystal oscillator, a USB connection, a power jack, 1 ICSP header, and a reset button.

All you need to do is connect it to a computer via a USB cable and power it with an external power supply of DC 7-12V.

| | |
|-----------------------------|---------------------------------------|
| Microcontroller | ATMEGA328P-AU |
| Operating Voltage | 5V |
| Input Voltage (recommended) | DC 7-12V |
| Digital I/O Pins | 14 (D0-D13) |
| PWM Digital I/O Pins | 6 (D3, D5, D6, D9, D10, D11) |
| Analog Input Pins | 6 (A0-A5) |
| Flash Memory | 32 KB (ATMEGA328P-PU) of which 0.5 KB |
| SRAM | 2 KB (ATMEGA328P-PU) |
| EEPROM | 1 KB (ATMEGA328P-PU) |
| Clock Speed | 16 MHz |

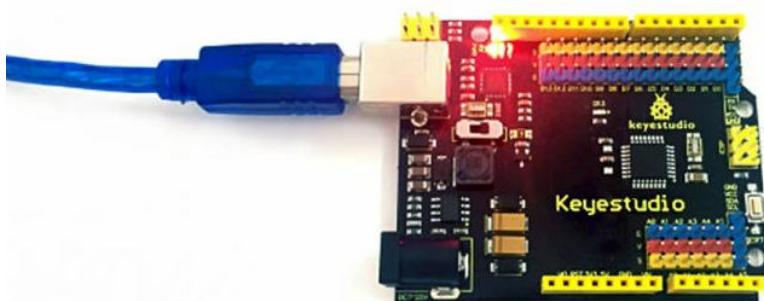

| Interface number | Introduce |
|------------------|---|
| 1 | <p>ICSP (In-Circuit Serial Programming) Header ICSP</p> <p>It is the AVR, an Arduino micro-program header consisting of MOSI, MISO, SCK, RESET, VCC, and GND. It is often called the SPI (serial peripheral interface) and can be considered an "extension" of the output. In fact, slave the output devices under the SPI bus host. When connecting to PC, program the firmware to ATMEGA328P-AU.</p> |
| 2 | <p>Serial Communication Pin</p> <p>Connect to serial communication. 4Pins (GND, VCC (3.3V or 5V controlled by slide switch), RX, TX)</p> |
| 3 | <p>GND</p> <p>Ground pins</p> |
| 4 | <p>V Pin (VCC)</p> <p>Power the external sensors and modules. Select the voltage of 3.3V or 5V via a slide switch.</p> |

| | |
|----|--|
| | Digital I/O |
| 5 | <p>It has 14 digital input/output pins, labeled D0 to D13 (of which 6 can be used as PWM outputs). These pins can be configured as digital input pin to read the logic value (0 or 1). Or used as digital output pin to drive different modules like LED, relay, etc. The pin D3, D5, D6, D9, D10, and D11 can be used to generate PWM.</p> <p>For digital port, you can connect through female headers, or through pin headers (labeled S) of 2.54mm pitch.</p> |
| 6 | AREF For Analog reference. Sometimes used to set an external reference voltage (0-5V) as the upper limit of analog input pins. |
| 7 | SDA IIC communication pin |
| 8 | SCL IIC communication pin |
| 9 | ICSP (In-Circuit Serial Programming) Header ICSP is an AVR, an Arduino micro-program header consisting of MOSI, MISO, SCK, RESET, VCC, and GND. Connected to ATMEGA 16U2-MU. When connecting to PC, program the firmware to ATMEGA 16U2-MU. |
| 10 | Microcontroller Each control board has its own microcontroller. You can regard it as the brain of your board. Microcontrollers are usually from ATMEL. Before you load a new program on the Arduino IDE, you must know what IC is on your board. This information can be checked at the top of IC. The microcontroller used in this board is ATMEGA328P-AU. |
| 11 | D13 LED There is a built-in LED driven by digital pin 13. When the pin is HIGH value, the LED is on, when the pin is LOW, it's off. |
| 12 | TX LED Onboard you can find the label: TX (transmit) When the board communicates via serial port, send the message, TX led flashes. |
| 13 | RX LED Onboard you can find the label: RX(receive) When the board communicates via serial port, receive the message, RX led flashes. |
| 14 | Power LED LED on means that your circuit board is correctly powered on. Otherwise LED is off. |

| | |
|----|--|
| | USB Connection |
| 15 | You can power the board via USB connection. Or can upload the program to the board via USB port. Connect the board to PC using a USB cable via USB port. |
| 16 | ATMEGA 16U2-MU |
| | USB to serial chip, can convert the USB signal into serial port signal. |
| 17 | Power Switch |
| | You can slide the switch to control the voltage of pin V (VCC), 3.3V or 5V. |
| | Voltage Regulator |
| 18 | To control the voltage provided to the board, as well as to stabilize the DC voltage used by the processor and other components. Convert an external input DC7-12V voltage into DC 5V, then switch DC 5V to the processor and other components, output DC 5V, drive current is 2A. |
| 19 | DC Power Jack |
| | The board can be supplied with an external power DC7-12V from the DC power jack. |
| 20 | IOREF |
| | Used to configure the operating voltage of microcontroller. Use it less. |
| 21 | RESET Header |
| | Connect an external button to reset the board. The function is the same as reset button. |
| 22 | Pin 3.3V |
| | Output Provides 3.3V voltage output |
| 23 | Pin 5V |
| | Output Provides 5V voltage output |
| 24 | Vin |
| | You can supply an external voltage input DC7-12V through this pin to the board. |
| | Analog Pins |
| 25 | The board has 6 analog inputs, labeled A0 through A5. Can also used as digital pins, A0=D14, A1=D15, A2=D16, A3=D17, A4=D18, A5=D19. For analog port, you can connect through female headers, or through pin headers (labeled S) of 2.54mm pitch. |
| | IIC Communication Pin |
| 26 | Connect to the IIC communication. 4Pins (GND, VCC (3.3V or 5V controlled by slide switch), SDA, SCL) |
| 27 | RESET Button |
| | You can reset your board to start the program from the initial status. |

2.4 Select Board and Port in Arduino IDE

Before uploading code to the connected control board, we need to select board and port in Arduino IDE.

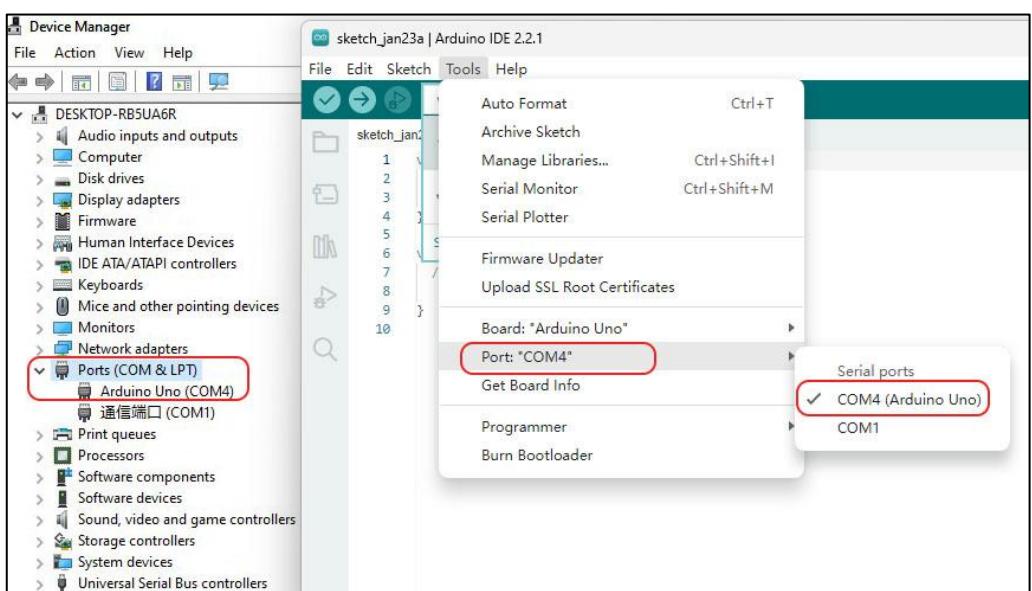

Two methods are introduced below:

1. Using the Board and Port selector of the Tool drop-down list
2. Using the board selector

1. Open the **Device Manager** by right-clicking “**My computer**” and selecting the **Properties**.

Look under **Ports (COM & LPT)**. You should see an open port named **Arduino UNO (COM-X)**.

Click on Tools, select “**Arduino UNO**” for the board type, and select **COM-XX** for Port as shown in the Device Manager.

2. Find the board selector and click to open. A list of ports will be displayed. If a board could be identified, the board name will be displayed, otherwise, it will display “Unknown”.

Click on **Arduino UNO/COM4** to select it.

2.5 Add Libraries to Arduino IDE

Why Use Libraries?

Libraries are incredibly useful when creating a project of any type. They make our development experience much smoother, and there almost an infinite amount out there. They are used to interface with many different sensors, RTCs, Wi-Fi modules, RGB matrices and of course with other components on your board.

Including a Library in the sketch

To use a library, you first need to [include the library at the top of the sketch](#).

If you find a line of code in the format of `#include <library name>` at the beginning of the code when using our code, it means that you need to add this library file to arduino IDE first before you can successfully upload this code.

The screenshot shows the Arduino IDE interface with the following code in the editor:

```
#include <dht11.h> //include the library code;
dht11 DHT;
#define DHT11_PIN 7 //define the DHT11 as the digital port 7

void setup() {
    Serial.begin(9600);
}

void loop() {
    int chk;
    chk = DHT.read(DHT11_PIN); //read data
    switch (chk) {
        case DHTLIB_OK:
            break;
        case DHTLIB_ERROR_CHECKSUM: //check and return errors
            break;
        case DHTLIB_ERROR_TIMEOUT: //timeout and return errors
            break;
        default:
            break;
    }
}
```

The status bar at the bottom right indicates "Ln 1, Col 1 Arduino Uno on C". Below the code editor, the terminal window displays the following error message:

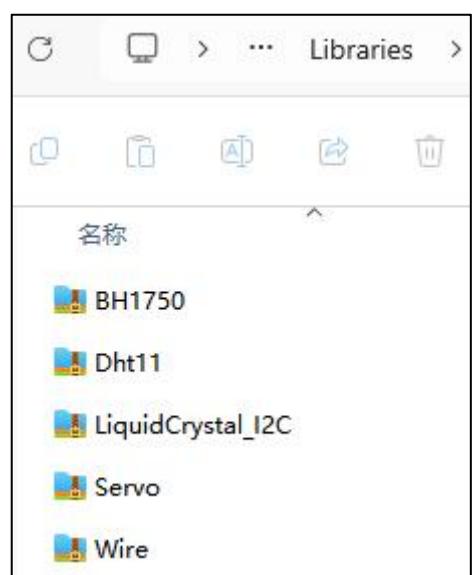

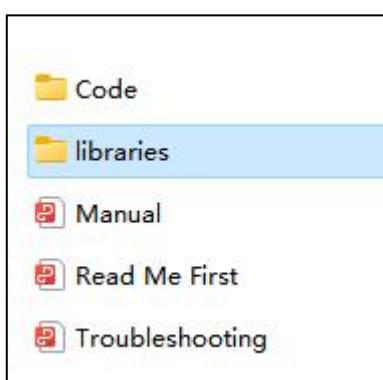

```
Administrator@Desktop\1\1.ino:1:10: fatal error: dht11.h: No such file or directory
#include <dht11.h> //include the library code:
| | | ^~~~~~
compilation terminated.
Alternatives for dht11.h: []
  - library(dht11.h)
  - candidates: []
: status 1

compilation error: dht11.h: No such file or directory
```

To make the solar tracking kit work, we need to add these files to the Arduino IDE.

All these libraries are came with the tutorial package we provided.

Tutorial Package

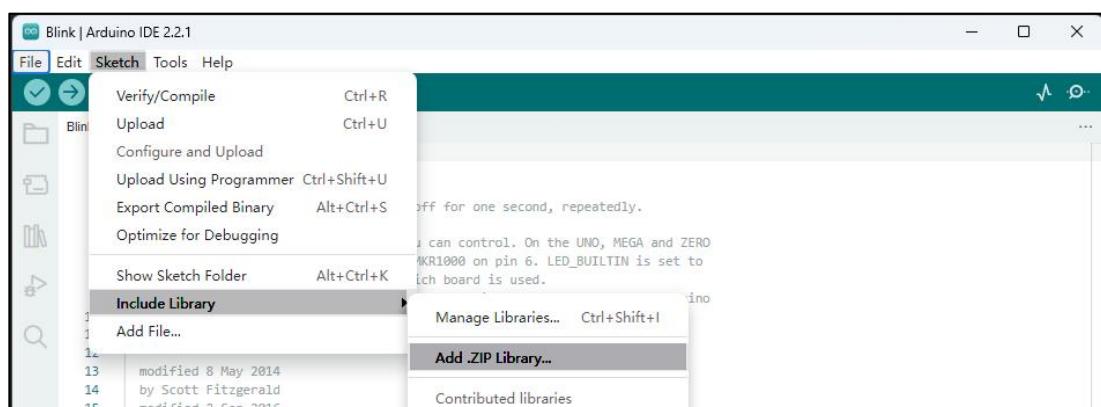

Two ways to add libraries to Arduino IDE

1) Method One: Importing a .zip Library

In the menu bar, go to **Sketch > Include Library > Add .ZIP Library...**

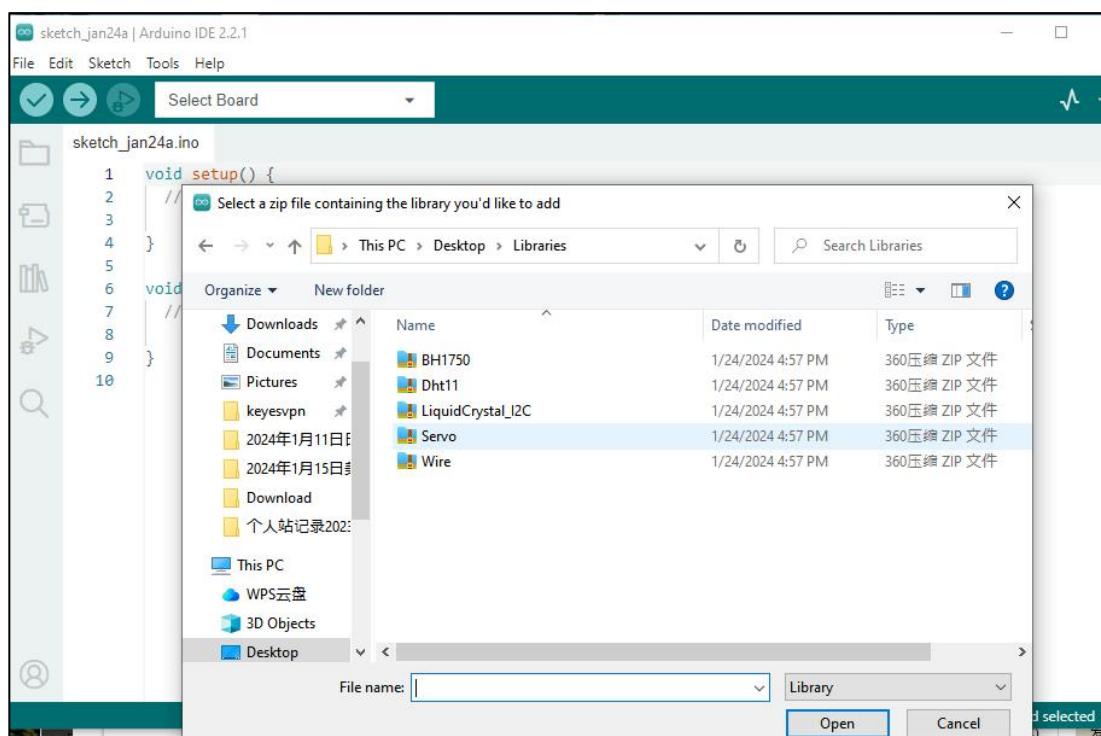

You will be prompted to select the library you want to add.

Navigate to the .zip file's location and open it.

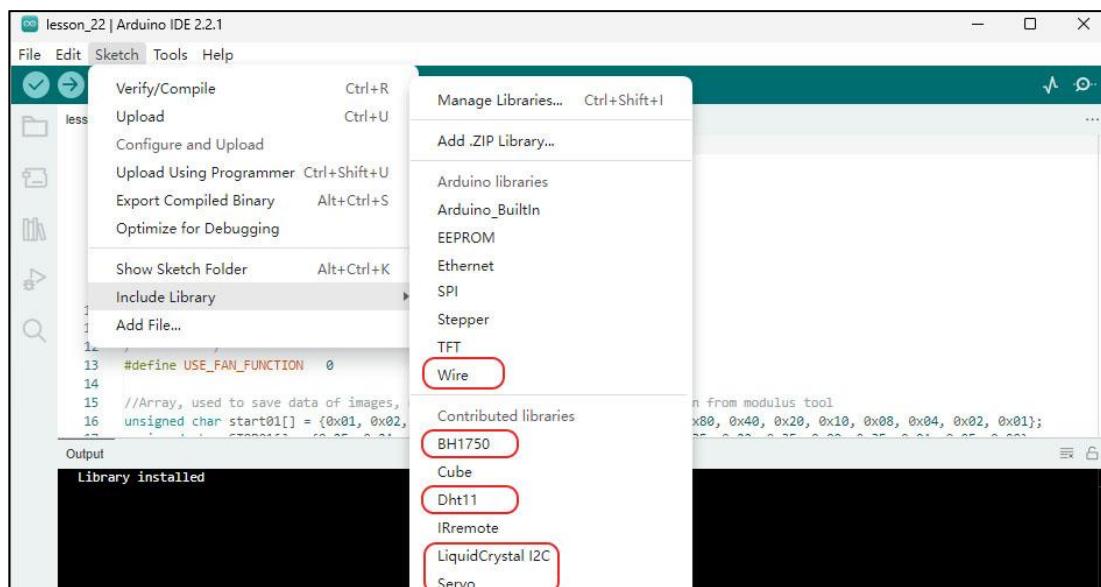

Select a zip file containing the library you'd like to add

These library files come with the tutorial package we provide.

You may need to restart the Arduino IDE for the library to be available.

After successful installation, you will see them in the list.

2) Method Two: Manual Installation

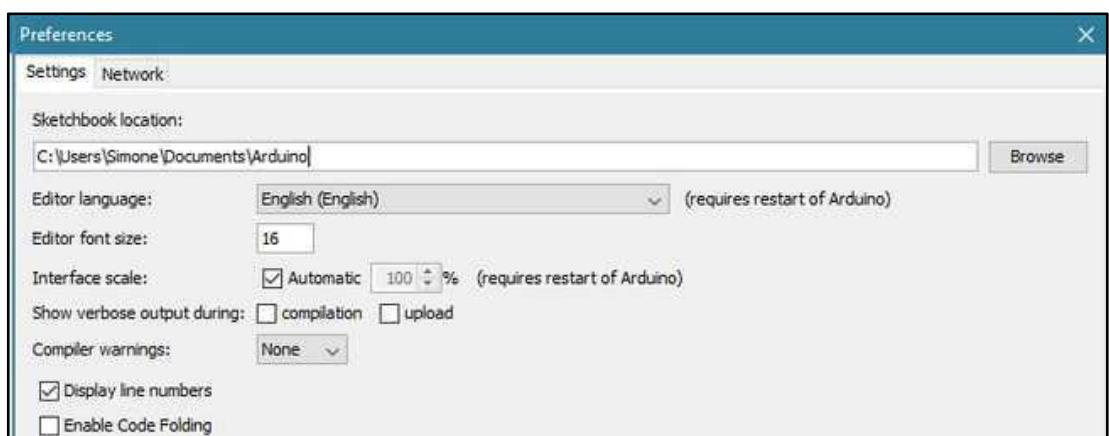

The default location where Arduino sketches you write will be saved is called the Sketchbook. The Sketchbook is simply a folder on your computer like any other. It acts as a handy repository for sketches and is also where add-on code libraries get saved.

Libraries Folder

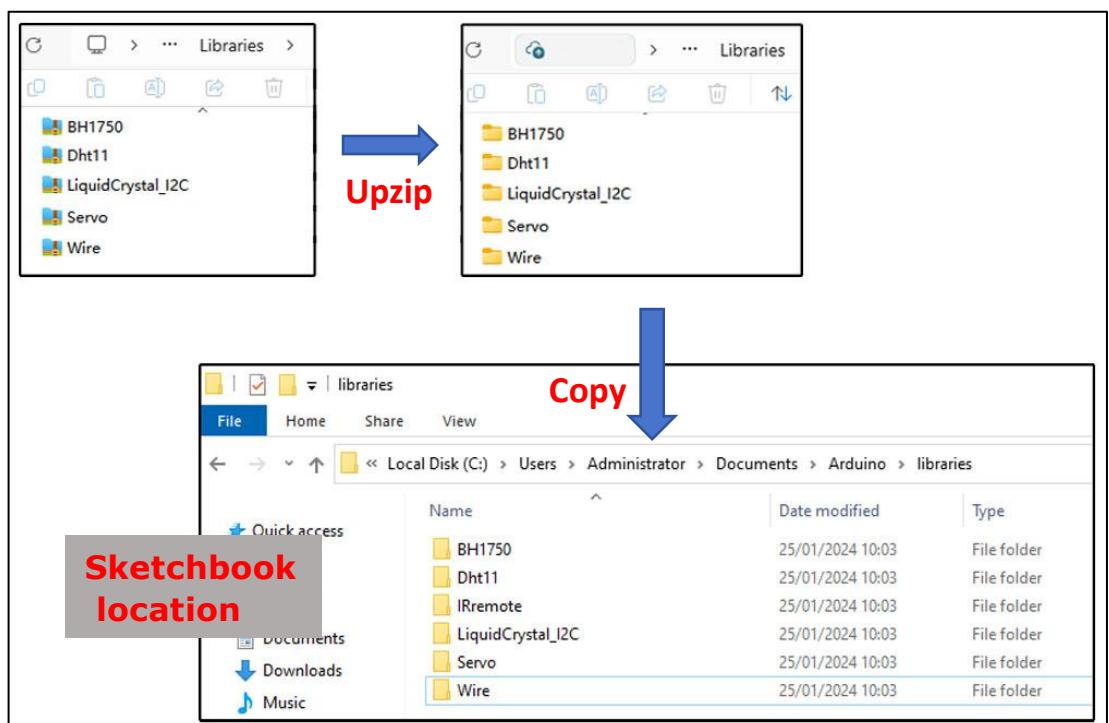

The **sketchbook\libraries** folder is the default location where libraries are installed to from the Arduino IDE.

If you want to add a library manually, the library file cannot be added as a zip file, you need to unzip it and put it in the **libraries** folder of your sketchbook by yourself.

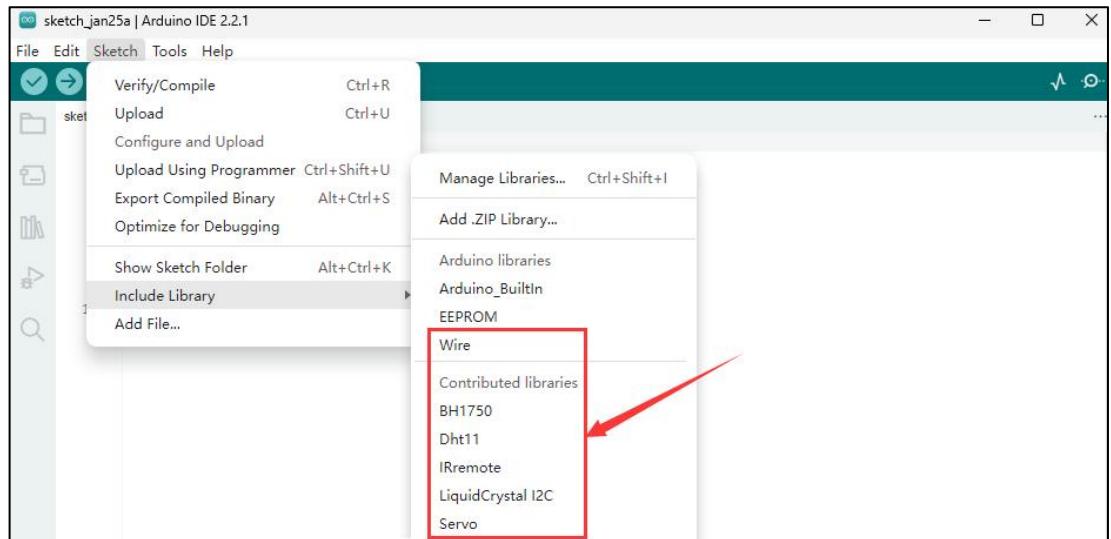

You can find or change the location of your sketchbook folder at **File > Preferences > Sketchbook location.**

Go to the directory where you have downloaded the ZIP file of the library. Unzip the ZIP file and copy it into the "**libraries**" folder inside your sketchbook. Note: If there is no libraries folder in the sketchbook folder, you need to create a new one yourself and copy the uncompressed library files into it.

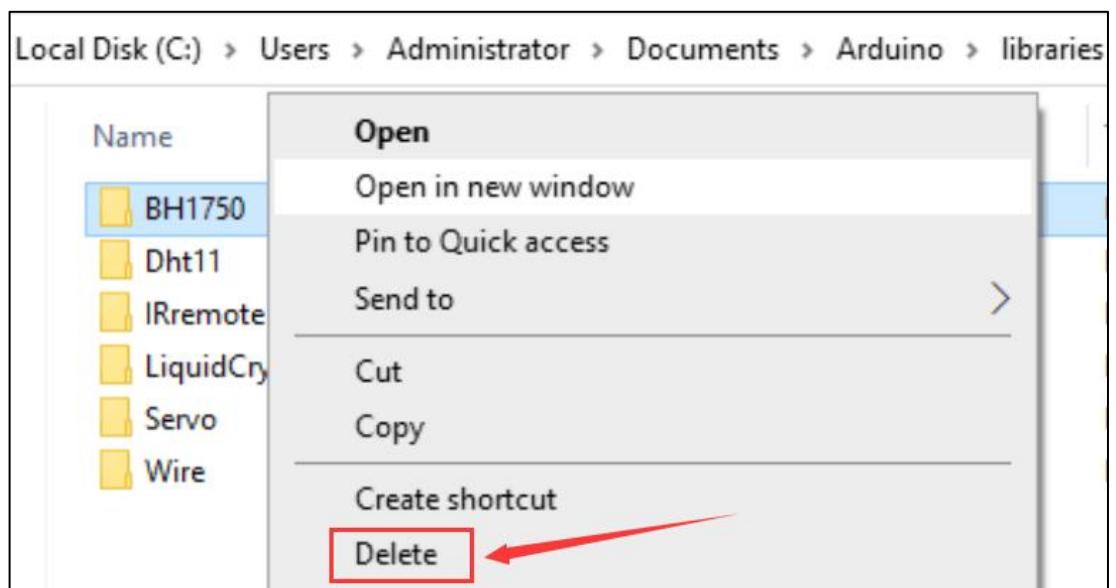

Start the Arduino Software (IDE), go to Sketch > Include Library. Verify that the library you just added is available in the list.

Uninstalling an Arduino Library

Uninstalling an Arduino Library is simpler than installing it. Find the sketchbook folder on your computer (same as in the “Manually installing a library” chapter). Go to the location and open the “libraries” folder. Select the folder containing the library you want to delete, and then simply delete it. Next time you open your Arduino IDE, there won’t be the deleted library under the Sketch > Include Library menu.

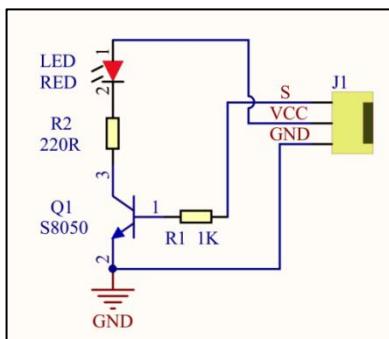

Libraries don't take much space and most of the time there is no reason to remove them. If you don't intend to use them again, though, and want to declutter the list, you can safely delete them. You can always install any Arduino Library again if you need to use it in the future.

3.Test Electronic Parts

Lesson 1.1: LED Blinks

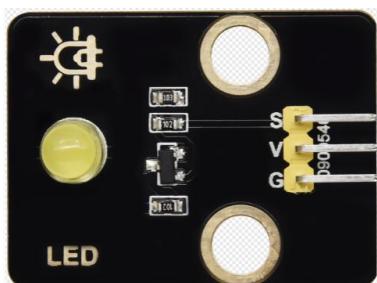

(1) Description:

LED, the abbreviation of light emitting diodes consists of Ga, As, P, N chemical compounds, and so on. The LED can flash in diverse colors by altering the delay time in the test code. When in control, power on GND and VCC, the LED will be on if the S end is at a high level; nevertheless, it will go off.

(2) Parameters:

Control interface: digital port
Working voltage: DC 3.3-5V
Pin spacing: 2.54mm
LED display color: yellow

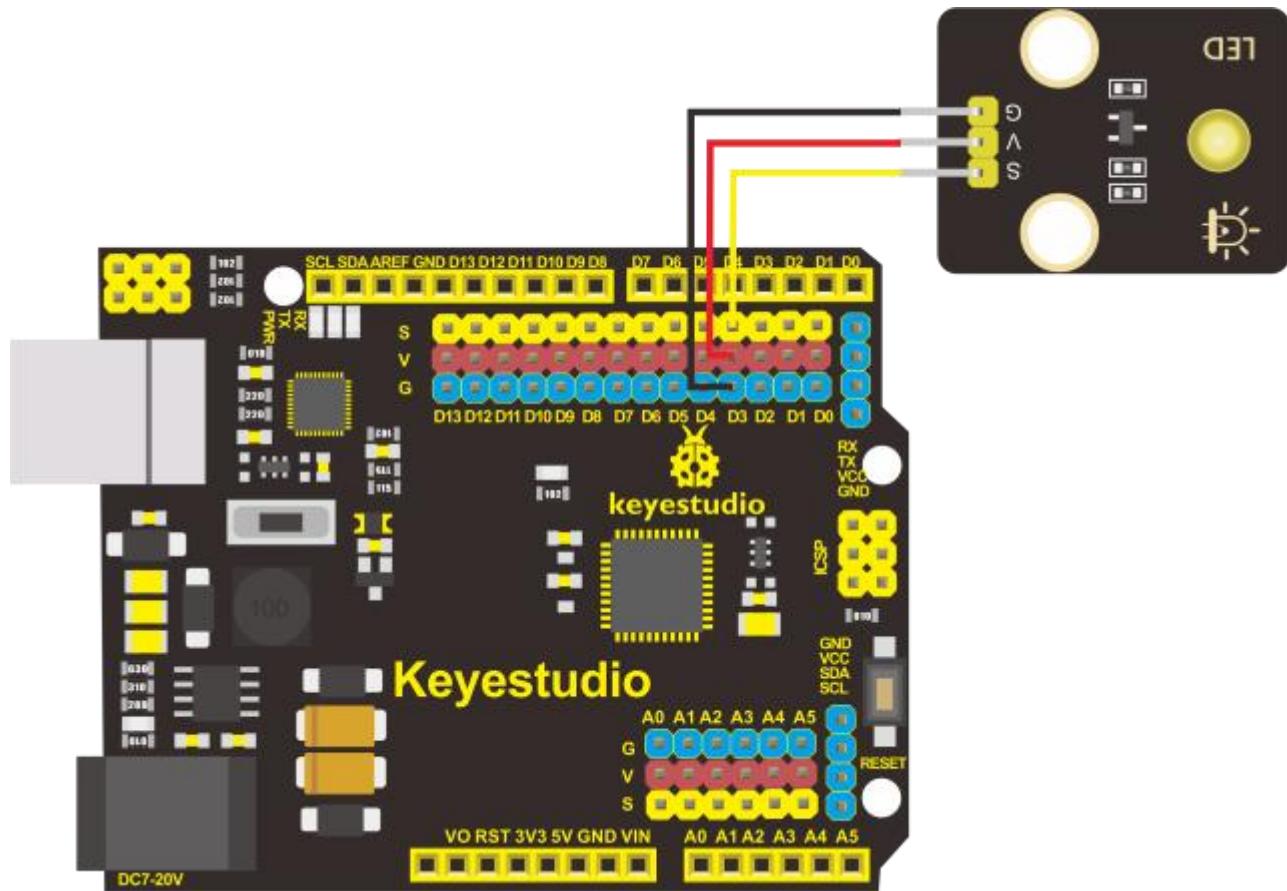

(3) You need to prepare:

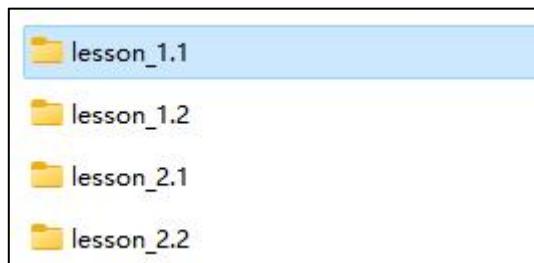

| Control Board*1 | USB Cable*1 | Yellow LED Module*1 | 3pin F-F 26AWG Wire |
|-----------------|-------------|---------------------|---------------------|
| | | | |

(4) Connection diagram of the led module:

The pin -, + and S of LED module are connected to the pin G, 5V and D3 port of

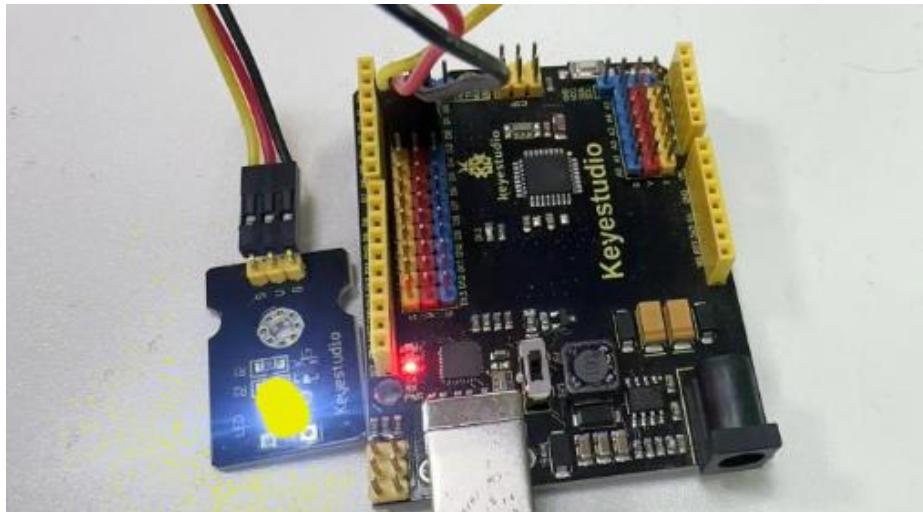

1. Connect the control board to the computer with the usb cable.
2. Open the INO file inside the **lesson_1.1** folder with Arduino IDE.

3. Click the board selector or tool menu to select "**Arduino UNO**" and **COM-XX**
4. Click upload >>> done uploading.

```
#define LED 3 //define the pin of LED as D3
void setup()
{
    pinMode(LED, OUTPUT); // initialize digital pin LED as an output.
}
void loop() // the loop function runs over and over again forever
{
    digitalWrite(LED, HIGH); // turn the LED on (HIGH is the voltage level
    delay(1000); // wait for a second
    digitalWrite(LED, LOW); // turn the LED off by making the voltage LOW
    delay(1000); // wait for a second
}
```

Test Results: LED blinks at the interval of 1s

(5) Code Explanations:

`pinMode(LED, OUTPUT)` - This function can denote that the pin is INPUT or OUTPUT

`digitalWrite(LED, HIGH)` - When pin is OUTPUT, we can set it to HIGH(output 5V) or LOW(output 0V)

Lesson 1.2: Changing the blinking frequency of the LED

>>>>> *This lesson is an expansion of the Lesson 1.1*

1. Connect the control board to the computer with the usb cable.

2. Open the INO file inside the **lesson_1.2** folder with Arduino IDE.

3. Click the board selector or tool menu to select "**Arduino UNO**" and **COM-XX**

4. Click upload >>> done uploading.

Test Results: You will see the LED flashes faster.

```

4   * Blink
5   * http://www.keyestudio.com
6   */
7 #define LED 3 //define the pin the LED as D3
8
9 void setup()
10 {
11     pinMode(LED, OUTPUT); // initialize digital pin LED as an output.
12 }
13 void loop() // the loop function runs over and over again forever
14 {
15     digitalWrite(LED, HIGH); // turn the LED on (HIGH is the voltage level
16     delay(100); // wait for a second
17     digitalWrite(LED, LOW); // turn the LED off by making the voltage LOW
18     delay(100); // wait for a second
19 }
20
```

Lesson 2.1: Adjust the Brightness of the LED

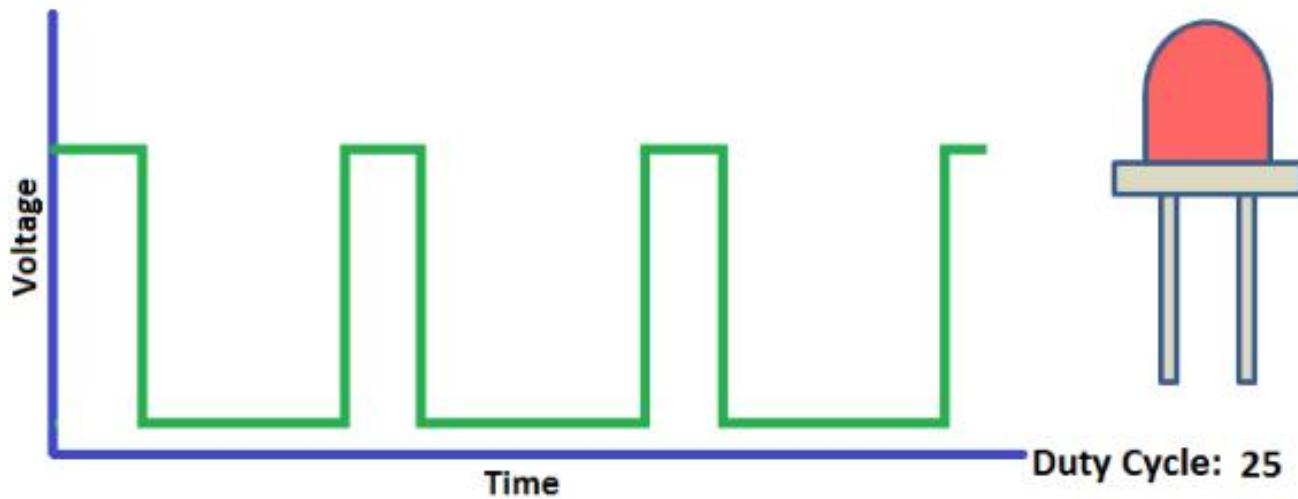

Hardware required for this lesson, the configuration of the arduino IDE, and the wiring between the LDE module and the control board is in the same way as [Lesson 1.1](#).

(1).Description:

In previous lesson, we control LED on and off and make it blink.

In this project, we will control LED brightness through PWM to simulate breathing effect. Similarly, you can change the step length and delay time in the code so as to demonstrate different breathing effect.

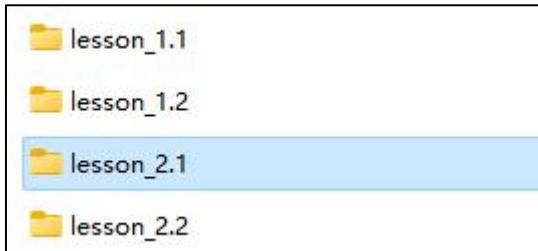

PWM is a means of controlling the analog output via digital means. Digital control is used to generate square waves with different duty cycles (a signal that constantly switches between high and low levels) to control the analog output. In general, the input voltage of port are 0V and 5V. What if the 3V is required? Or what if switch among 1V, 3V and 3.5V? We can't change resistor constantly. For this situation, we need to control by PWM.

For the Arduino digital port voltage output, there are only LOW and HIGH, which correspond to the voltage output of 0V and 5V. You can define LOW as 0 and HIGH as 1, and let the Arduino output five hundred 0 or 1 signals within 1 second.

If output five hundred 1, that is 5V; if all of which is 1, that is 0V. If output 010101010101 in this way then the output port is 2.5V, which is like showing movie. The movie we watch are not completely continuous. It actually outputs 25 pictures per second. In this case, the human can't tell it, neither does PWM. If want different voltage, need to control the ratio of 0 and 1. The more 0,1 signals output per unit time, the more accurately control.

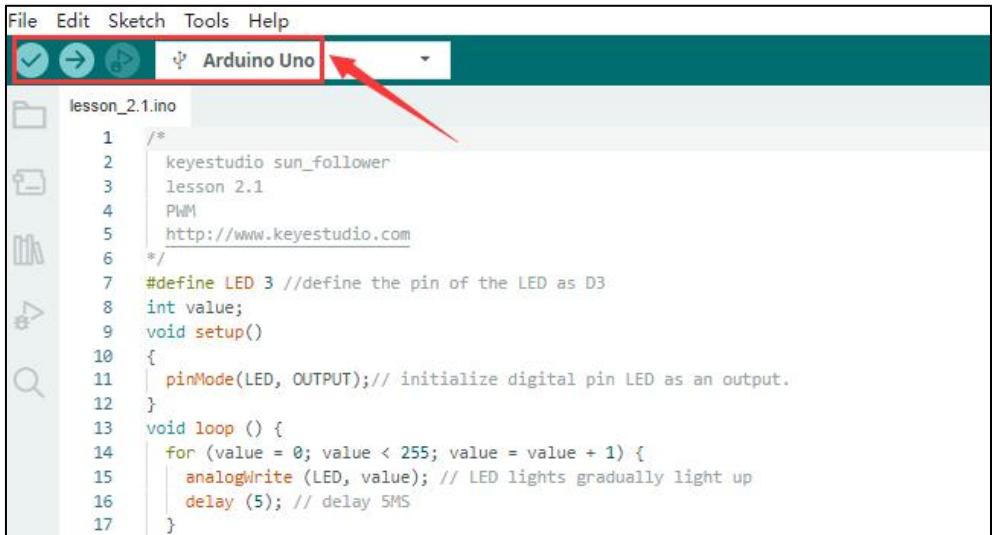

1. Connect the control board to the computer with the usb cable.
2. Open the INO file inside the **lesson_2.1** folder with Arduino IDE.

3.Click the board selector or tool menu to "**Arduino UNO**" and **COM-XX**

4.Click upload >>>done uploading.

Test Results: The LED gradually changes from bright to dark, rather than turning on and off.

(2).Code Explanation:

When we need to repeat some statements, we could use FOR statement.
FOR statement format is shown below:

```

①           ② condition is true ④
for (cycle initialization; cycle condition; cycle adjustment statement) {
③ loop body statement; ←
}

```

FOR cyclic sequence:

Round 1: 1 → 2 → 3 → 4

Round 2: 2 → 3 → 4

...

Until number 2 is not established, “for” loop is over,

After knowing this order, go back to code:

```
for (int value = 0; value < 255; value=value+1){
```

```
...}
```

```
for (int value = 255; value >0; value=value-1){
```

```
...}
```

The two “for” statements make value increase from 0 to 255, then reduce from 255 to 0, then

increase to 255,...infinitely loop

There is a new function in the following —— `analogWrite()`

We know that digital port only has two state of 0 and 1. So how to send an analog value to a digital value? Here, this function is needed. Let's observe the Arduino board and find 6 pins marked “~” which can output PWM signals.

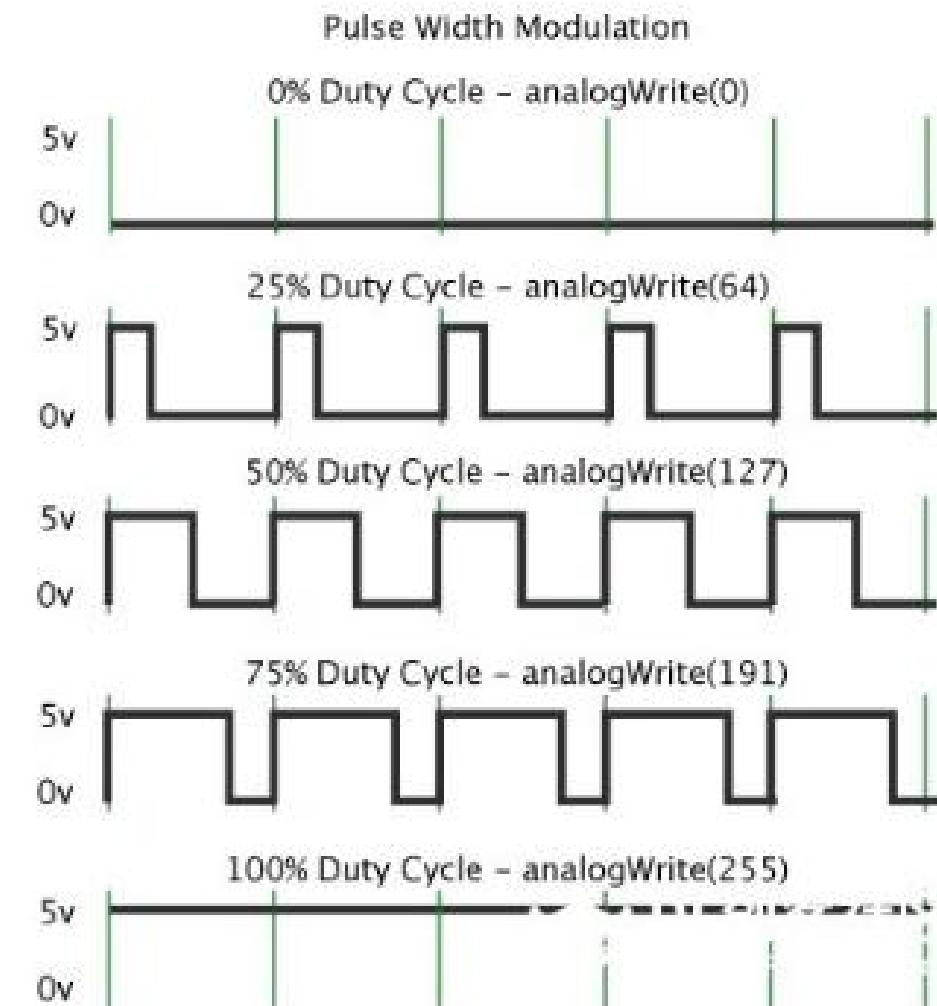

Function format as follows:

`analogWrite(pin,value)`

`analogWrite()` is used to write an analog value from 0~255 for PWM port, so the value is in the range of 0~255. Attention that you only write the digital pins with PWM function, such as pin 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 44, 45, 46.

PWM is a technology to obtain analog quantity through digital method. Digital control forms a square wave, and the square wave signal only has two states of turning on and off (that is, high or low levels). By controlling the ratio of the duration of turning on and off, a voltage varying from 0 to 5V can be simulated. The time turning on (academically referred to as high level) is called pulse width, so PWM is also called pulse width modulation.

Through the following five square waves, let's acknowledge more about PWM.

In the above figure, the green line represents a period, and value of analogWrite() corresponds to a percentage which is called Duty Cycle as well. Duty cycle implies that high-level duration is divided by low-level duration in a cycle. From top to bottom, the duty cycle of first square wave is 0% and its corresponding value is 0. The LED brightness is lowest, that is, turn off. The more time high level lasts, the brighter the LED. Therefore, the last duty cycle is 100%, which correspond to 255, LED is brightest. 25% means darker.

PWM mostly is used for adjusting the LED brightness or rotation speed of motor.

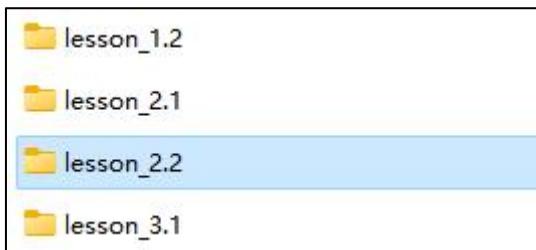

It plays vital role in controlling smart robot car.

Lesson 2.2: Slow down the change of the brightness of the LED

>>>>> *This lesson is an expansion of the Lesson 2.1*

Hardware required for this lesson, the configuration of the arduino IDE, and the wiring between the LDE module and the control board is in the same way as [Lesson 1.1](#).

1. Connect the control board to the computer with the usb cable.
2. Open the INO file inside the [lesson_2.2](#) folder with Arduino IDE.

3. Click the board selector or tool menu to "Arduino UNO" and **COM-XX**
4. Click upload >>>done uploading.

Test Results: Compared to the last lesson, the brightness of the LED changes slower.

```

lesson_2.2 | Arduino IDE 2.2.1

7 #define LED 3 //define the pin of the LED as D3
8 int value;
9
10 void setup()
11 {
12   pinMode(LED, OUTPUT); // initialize digital pin LED as an output.
13 }
14 void loop () {
15   for (value = 0; value < 255; value = value + 1) {
16     analogWrite (LED, value); // LED lights gradually light up
17     delay (20); // delay 20MS
}

```

Lesson 3.1: Read the Digital Signal of Button Module

(1) Description

In this project, we intend to use the push button module to control the LED.

(2) Parameters:

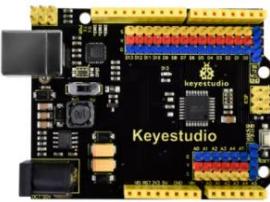

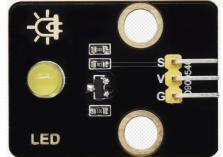

Working voltage: DC 3.3-5V

Control signal: digital signal

Size: 34mm

Weight: 3.8g

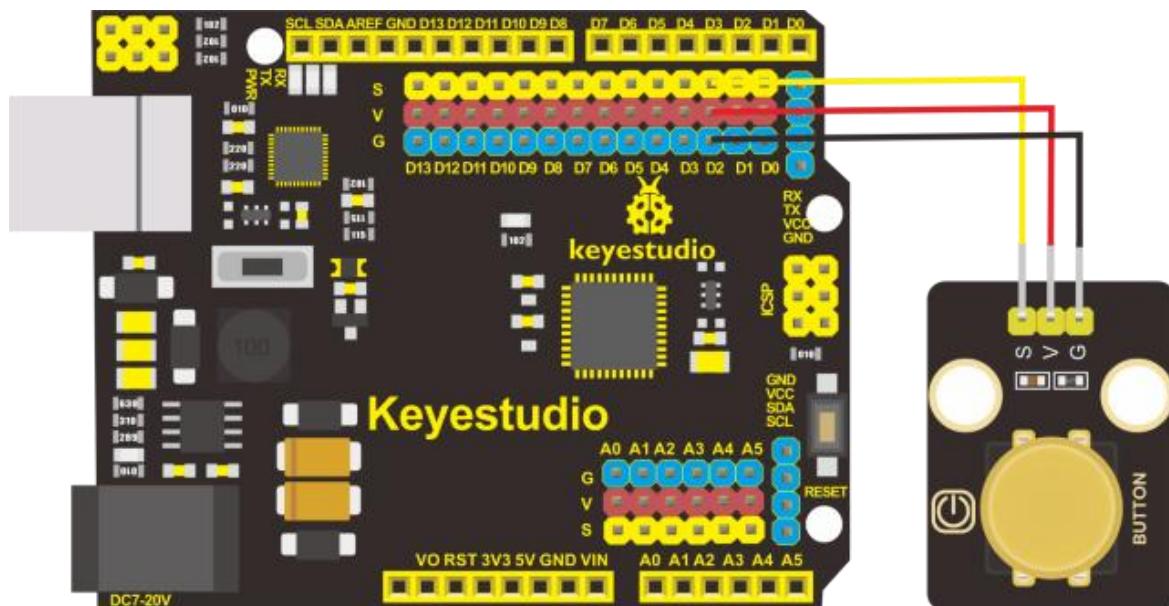

(3) You need to prepare:

| Control Board*1 | USB Cable*1 | Yellow LED Module*1 | 3pin F-F 26AWG Wire*2 | Push Button Module*1 |
|---|--|--|--|--|
|  |  |  |  |  |

(4) Connection Diagram

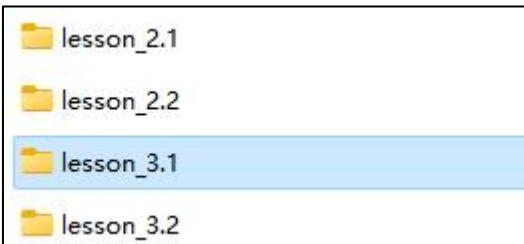

| Pin Connection Table | |
|--------------------------|----------------------|
| Pin of the Button | Pin of Control Board |
| G | G/D2 |
| V | V/D2 |
| S | S/D2 |

| Pin Connection Table | |
|-----------------------|----------------------|
| Pin of the LED | Pin of Control Board |
| G | G/D3 |
| V | V/D3 |
| S | S/D3 |

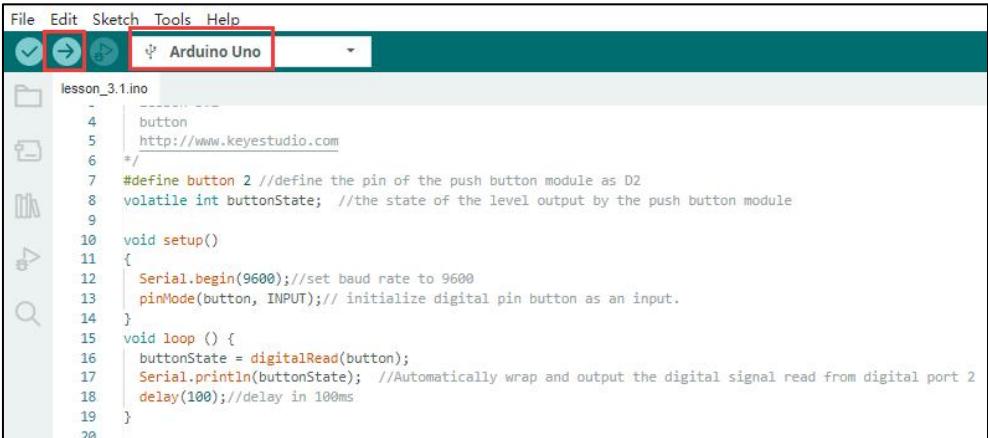

1. Connect the control board to the computer with the usb cable.

2. Open the INO file inside the **lesson_3.1** folder with Arduino IDE.

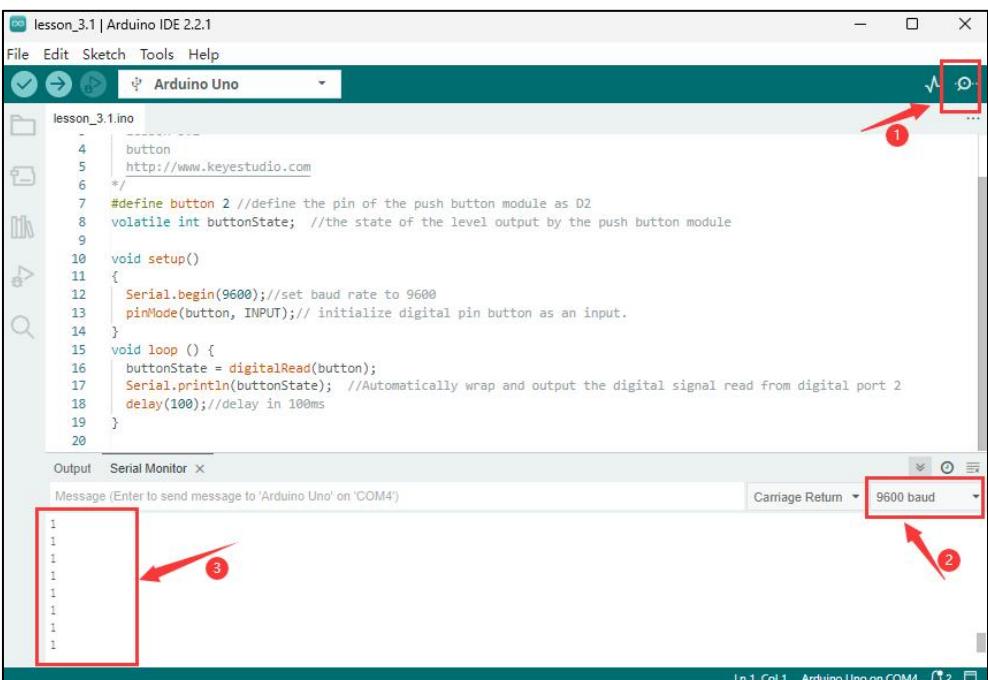

3. Click the board selector or tool menu to "**Arduino UNO**" and **COM-XX**

4. Click upload >>>done uploading.

Test Results: After the code has been successfully uploaded. The value 1 output from the pushbutton module will be displayed on the serial monitor because the pushbutton module is at high level. When you press the button for a long time leaving the button module at a low level., the serial monitor will display the value 0.

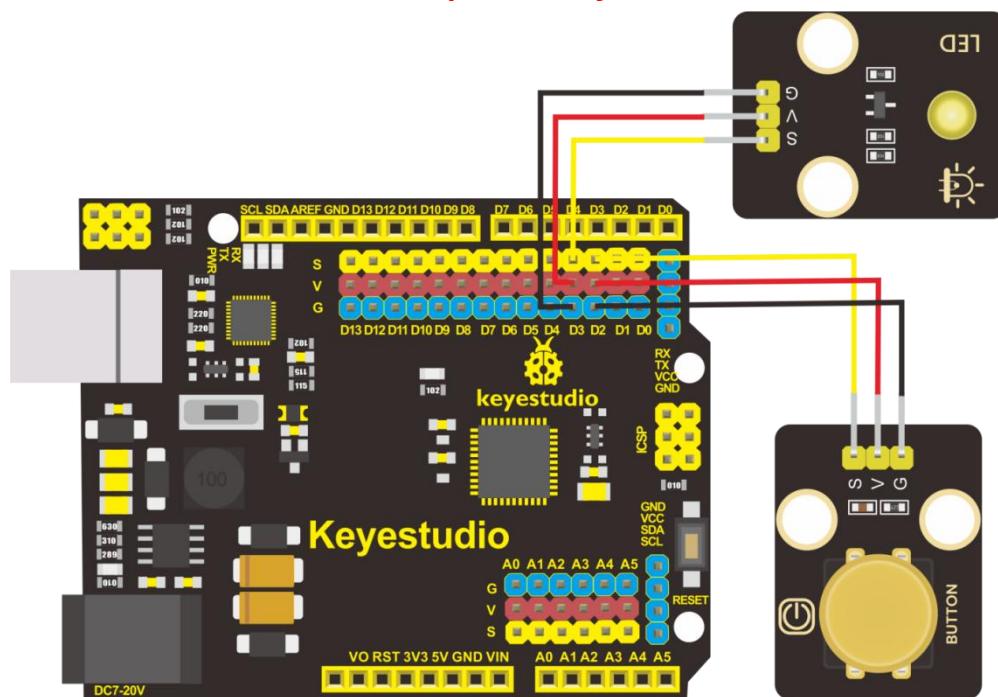

(5)Code Explanation:

Serial.begin(9600)-initialize the serial communication and set the baud rate to 9600
pinMode(pin, INPUT)-use the function pinMode() to tell Arduino whether it is an output pin or an input pin

digitalRead(pin)-read the digital level of pins, be HIGH OR LOW

Lesson 3.2: Control the LED by the Button Module

>>>>> *This lesson is an expansion of the Lesson 3.1*

1. Connect the control board to the computer with the usb cable.

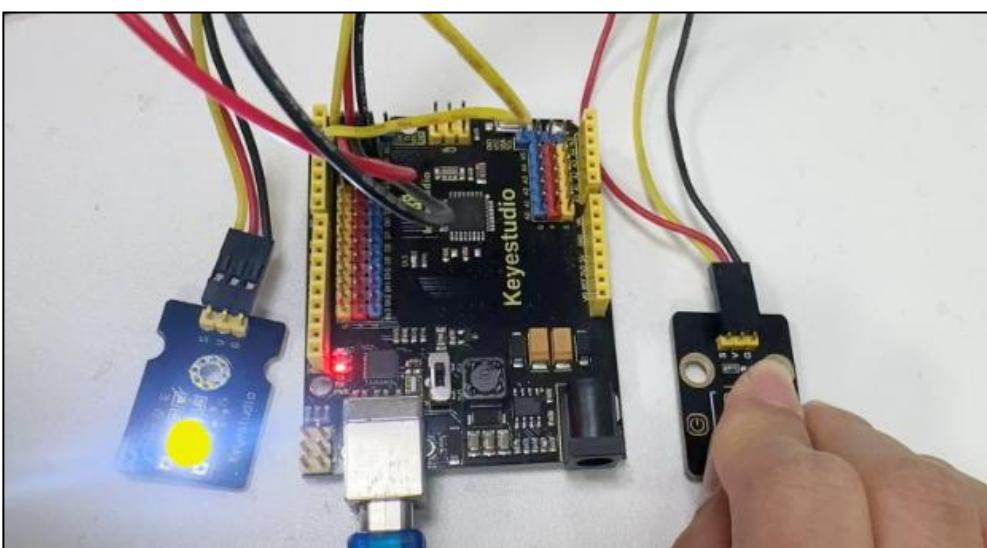

2. Open the INO file inside the **lesson_3.2** folder with Arduino IDE.

3. Click the board selector or tool menu to "**Arduino UNO**" and **COM-XX**

4. Click upload >>>done uploading.

```
lesson_3.2.ino
1  /*
2   * keyestudio sun_follower
3   * lesson 3.2
4   * button
5   * http://www.keyestudio.com
6   */
7  #define LED 3 //define the LED pin as D3
8  #define button 2 //define the pin of the push button module as D2
9  volatile int buttonState; //the state of the level output by the push
10 void setup()
11 {
12     Serial.begin(9600); //set baud rate to 960
13     pinMode(button, INPUT); // initialize digital pin button as an input.
14     pinMode(LED, OUTPUT); // initialize digital pin LED as an output.
15 }
16 void loop ()
17 {
18     buttonState = digitalRead(button); //read the state of the push button module
19     if (buttonState == 0) //if the button is pressed
20         digitalWrite(LED, HIGH);
21 }
```

Test Results: After the code has been successfully uploaded, keep powering the control board from the computer using the USB cable. when the button is pressed, the LED lights up; otherwise, it remains off.

Lesson 4.1: Passive Buzzer

(1) Description

There are prolific interactive works completed by Arduino. The most common one is sound and light display. We always use LED to make experiments. For this lesson, we design circuit to emit sound. The universal sound components are buzzer and horns. Buzzer is easier to use. And buzzer includes about active buzzer and passive buzzer. In this experiment, we adopt passive buzzer.

While using passive buzzer, we can control different sound by inputting square waves with distinct frequency. During the experiment, we control code to make buzzer sound, begin with “tick, tick” sound, then make passive buzzer emit “do re mi fa so la si do”, and play specific songs.

(2) Parameters:

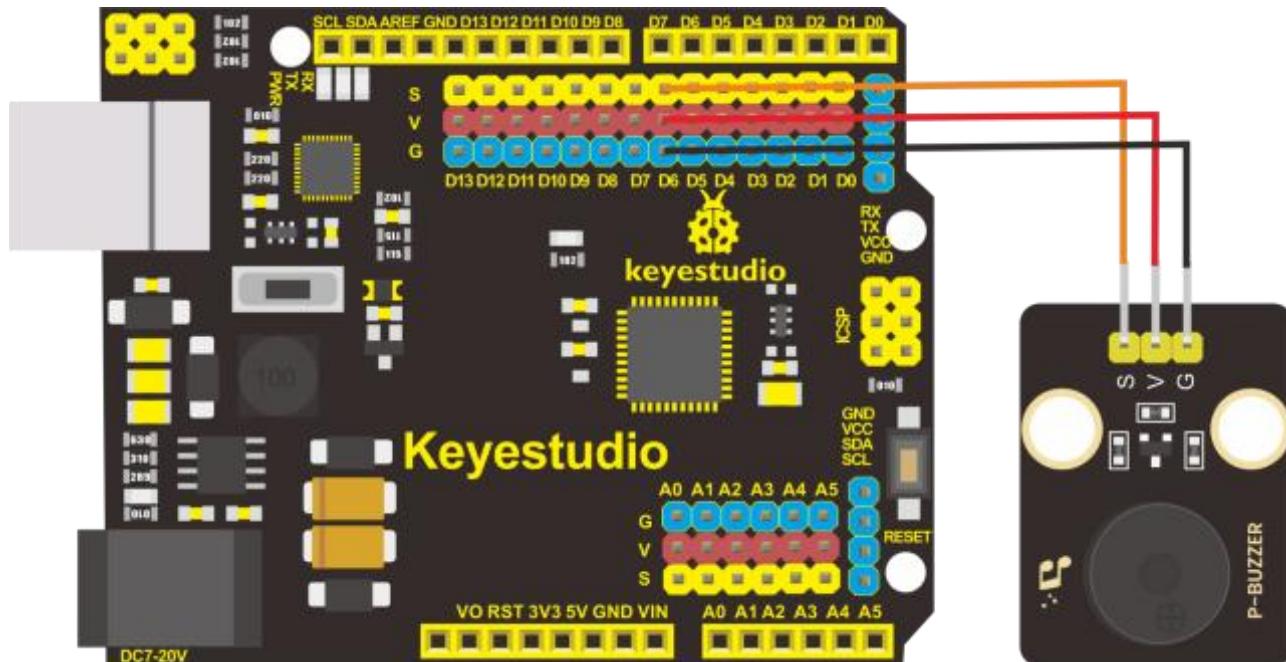

Control interface: digital port

Working voltage: DC 3.3-5V

(3) You need to prepare:

| Control Board*1 | USB Cable*1 | Passive Buzzer*1 | 3pin F-F 26AWG Wire |
|---|---|--|---|
|  |  |  |  |

(4) Connection Diagram:

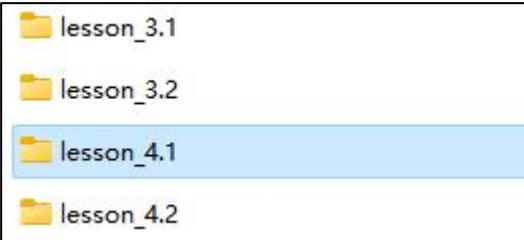

The G, V and S pins of passive buzzer are connected to G, V and D6 of the control Board.

| Pin Connection Table | |
|--------------------------|----------------------|
| Pin of the Buzzer | Pin of Control Board |
| G | G |
| V | V |
| S | D6 |

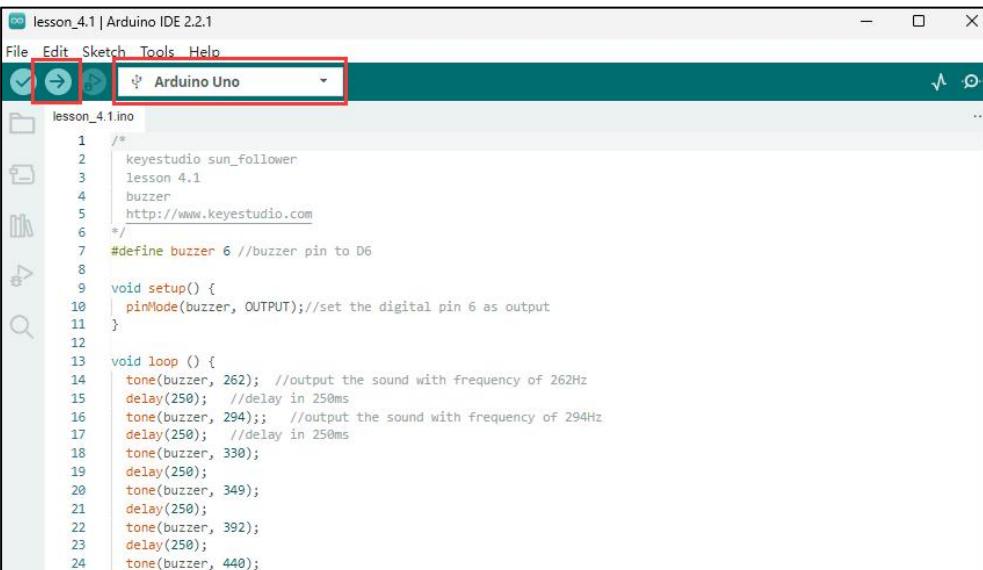

1. Connect the control board to the computer with the usb cable.

2. Open the INO file inside the **lesson_4.1** folder with Arduino IDE.

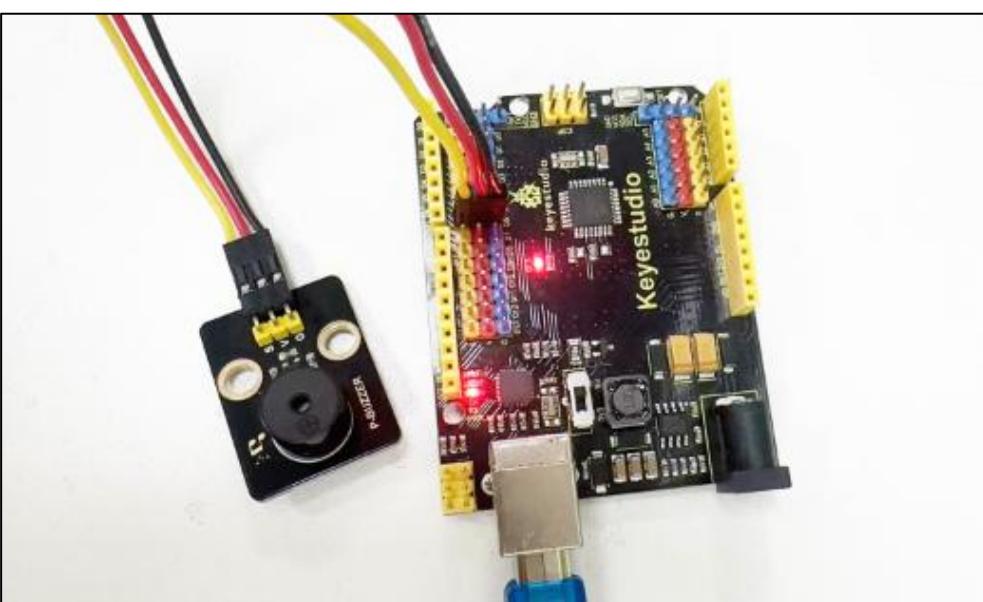

3. Click the board selector or tool menu to "**Arduino UNO**" and **COM-XX**

4. Click upload >>>done uploading.

Test Results: After the code has been successfully uploaded, keep powering the control board from the computer using the USB cable. The buzzer module will emit “do re mi fa so la si do” .

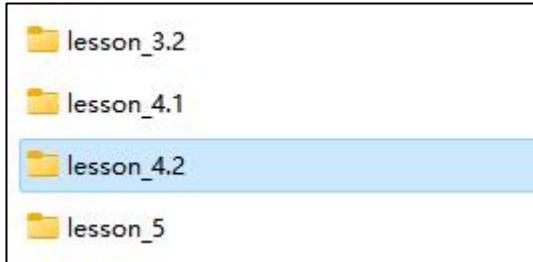

Lesson 4.2: Use Passive Buzzer to Play Music

>>>>> **This lesson is an expansion of the Lesson 4.1**

In the last lesson, we make the buzzer module emit "do re mi fa so la si do". In this lesson, we will upload different code to make the passive buzzer play "Happy Birthday".

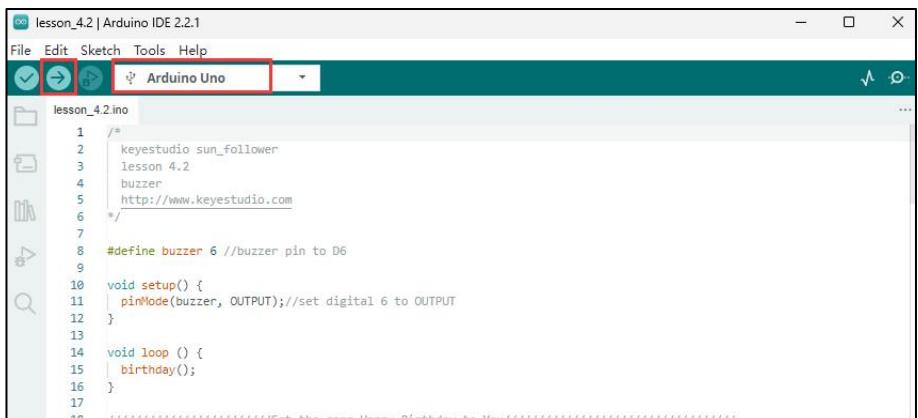

1. Connect the control board to the computer with the usb cable.

2. Open the INO file inside the **lesson_4.2** folder with Arduino IDE.

3. Click the board selector or tool menu to "**Arduino UNO**" and **COM-XX**

4. Click upload >>>done uploading.

Test Results: After the code has been successfully uploaded, keep powering the control board from the computer using the USB cable. The buzzer module will emit "do re mi fa so la si do".

Lesson 5: 1602 LCD Display Module

(1) Description:

With I2C communication module, this is a display module that can show 2 lines with 16 characters per line.

It shows blue background and white word and connects to I2C interface of MCU, which highly save the MCU resources.

On the back of LCD display, there is a blue potentiometer for adjusting the backlight. The communication address defaults to 0x27.

The original 1602 LCD can start and run with 11 IO ports, but ours is built with ARDUINOIIC/I2C interface, saving 9 IO ports. Alternatively, the module comes with 4 positioning holes with a diameter of 3mm, which is convenient for you to fix on other devices.

(2) Parameters:

I2C address: 0x27

Backlight (blue, white)

Power supply voltage: **5V**

Adjustable contrast

GND: A pin that connects to ground

VCC: A pin that connects to a +5V power supply

SDA: A pin that connects to analog port A4 for IIC communication

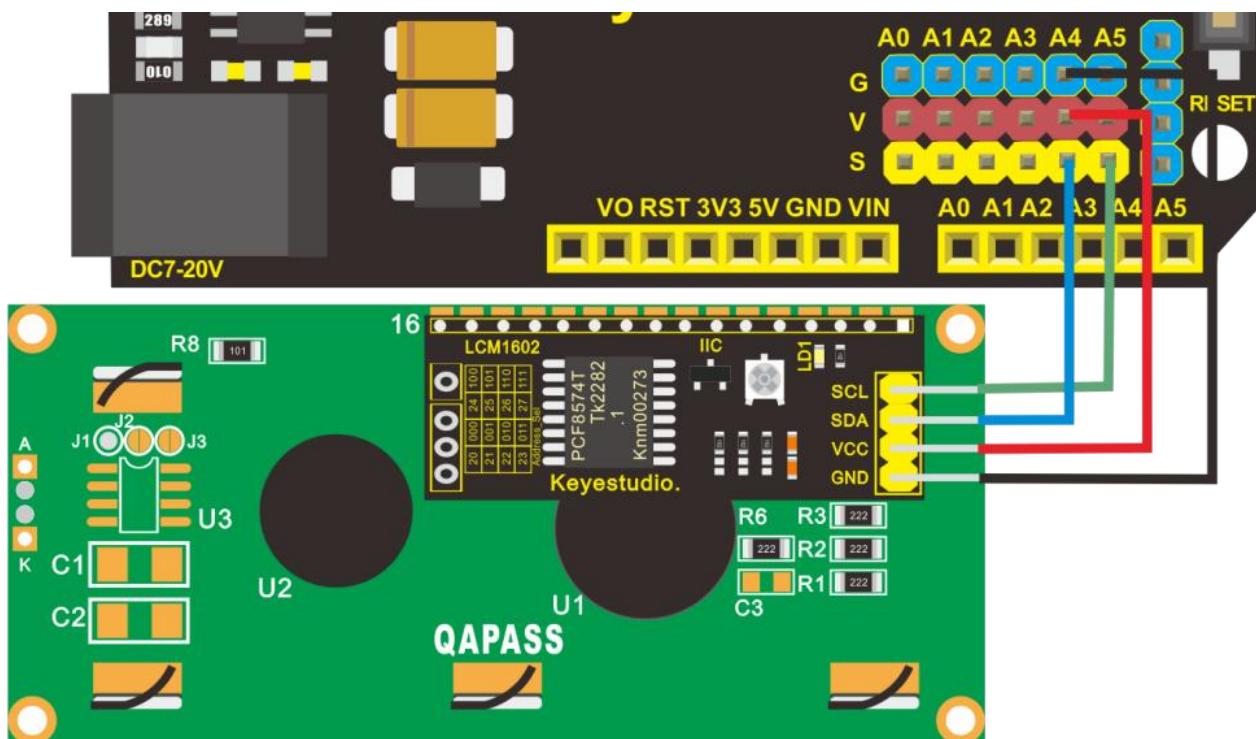

SCL: A pin that connects to analog port A5 for IIC communication

(3) You need to prepare:

| Control Board*1 | USB Cable*1 | LCD Display*1 | 4P-1P F-F DuPont Wire |
|-----------------|-------------|---------------|-----------------------|
| | | | |

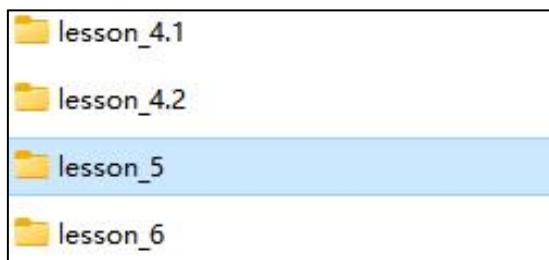

(4)Connection Diagram

| Pin Connection Table | |
|------------------------|----------------------|
| Pin of the LCD Display | Pin of Control Board |
| GND | G/A4 |
| VCC | V/A4 |
| SDA | S/A4 |
| SCL | S/A5 |

1. Connect the control board to the computer with the usb cable.

2. Open the INO file inside the **lesson_5** folder with Arduino IDE.

3. Click the board selector or tool menu to "**Arduino UNO**" and **COM-XX**

4. Click upload >>>done uploading.

```

lesson_5.ino
1  /*
2   * keyestudio sun_follower
3   * lesson 5.1
4   * I2C 1602
5   * http://www.keyestudio.com
6   */
7  #include <Wire.h>
8  #include <LiquidCrystal_I2C.h> // includes the LiquidCrystal_I2C Library
9  LiquidCrystal_I2C lcd(0x27, 16, 2); // set the LCD address to 0x27 for a 16 chars and 2 line d
10
11 void setup() {
12     lcd.init();
13     // Print a message to the LCD.
14     lcd.backlight(); //set backlight
15     lcd.setCursor(0, 0); //set Cursor at(0,0)
16     lcd.print("Hello, World!"); //display"Hello, World!"
17     lcd.setCursor(0, 1); //set Cursor at(0,1)

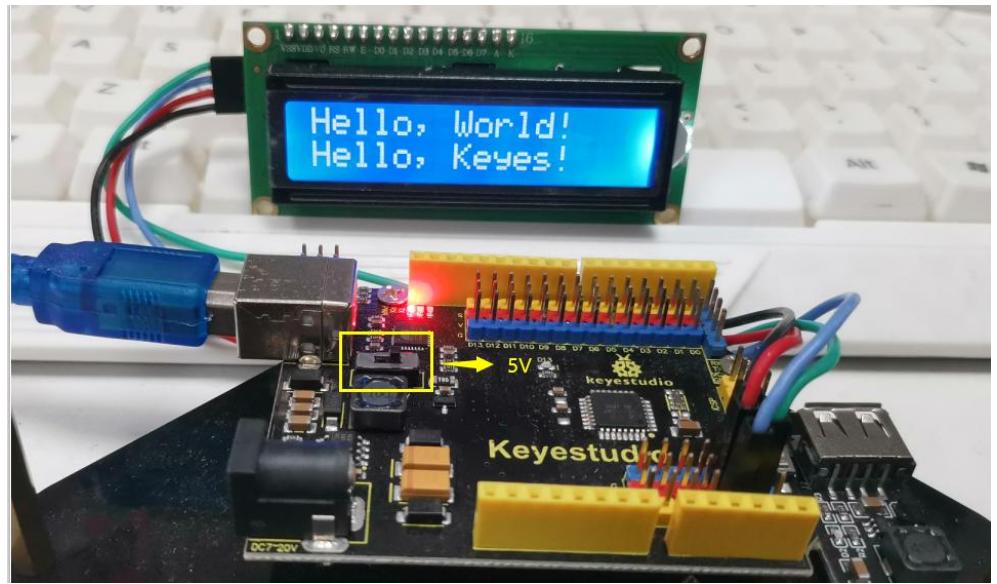

```

Note: Before uploading the code, make sure you have installed the <[Wire.h](#)> and <[LiquidCrystal_I2C.h](#)> library files.

```
3  lesson 5.1
4  I2C 1602
5  http://www.keyestudio.com
6  */
7  #include <Wire.h>
8  #include <LiquidCrystal_I2C.h> // includes the Liq
9  LiquidCrystal_I2C lcd(0x27, 16, 2); // set the LCD
10
11
```

Note: The working voltage of the LCD Display is 5V, please make sure the 3.3-5V Switch on the control board is dial to 5V.

Test Results: After the code has been successfully uploaded, keep powering the control board from the computer using the USB cable. The LCD Display will display “Hello World! ” at the first row and show “ Hello Keyes! ” at the second row.

Lesson 6: Photosensitive Sensor

(1)Description

There are four photoresistor sensor modules in this kit, the ambient light sensors, with photoresistor as main component.

The resistance of a photoresistor varies with the light intensity. When there is light around, its resistance ranges in $5\text{-}10\text{K } \Omega$; while when it is dark, the resistance is only $0.2\text{M } \Omega$. Based on this property, a circuit can be built to convert the change in resistance to changes in voltage. What's more, the sensor comes with an anti-reverse insertion terminal with a pitch of 2.54mm to facilitate the wiring. It is also compatible with many kinds of microcontrollers, such as the Arduino microcontroller series.

Here, we apply this sensor with the Arduino microcontroller. The S (signal) end of the sensor should be input to the analog pin of Arduino to detect the variation in analog value which will be printed on the serial monitor. And please notice that there are two positioning holes with a diameter of 4.9mm built on the sensor to help fix it.

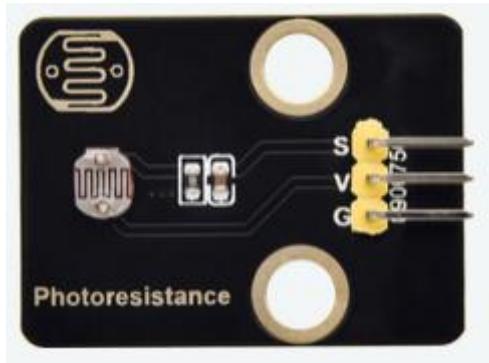

(2)Parameters:

Working voltage: 3.3V-5V (DC)

Interface: 3PIN

Output signal: analog signal

Weight: 2.3g

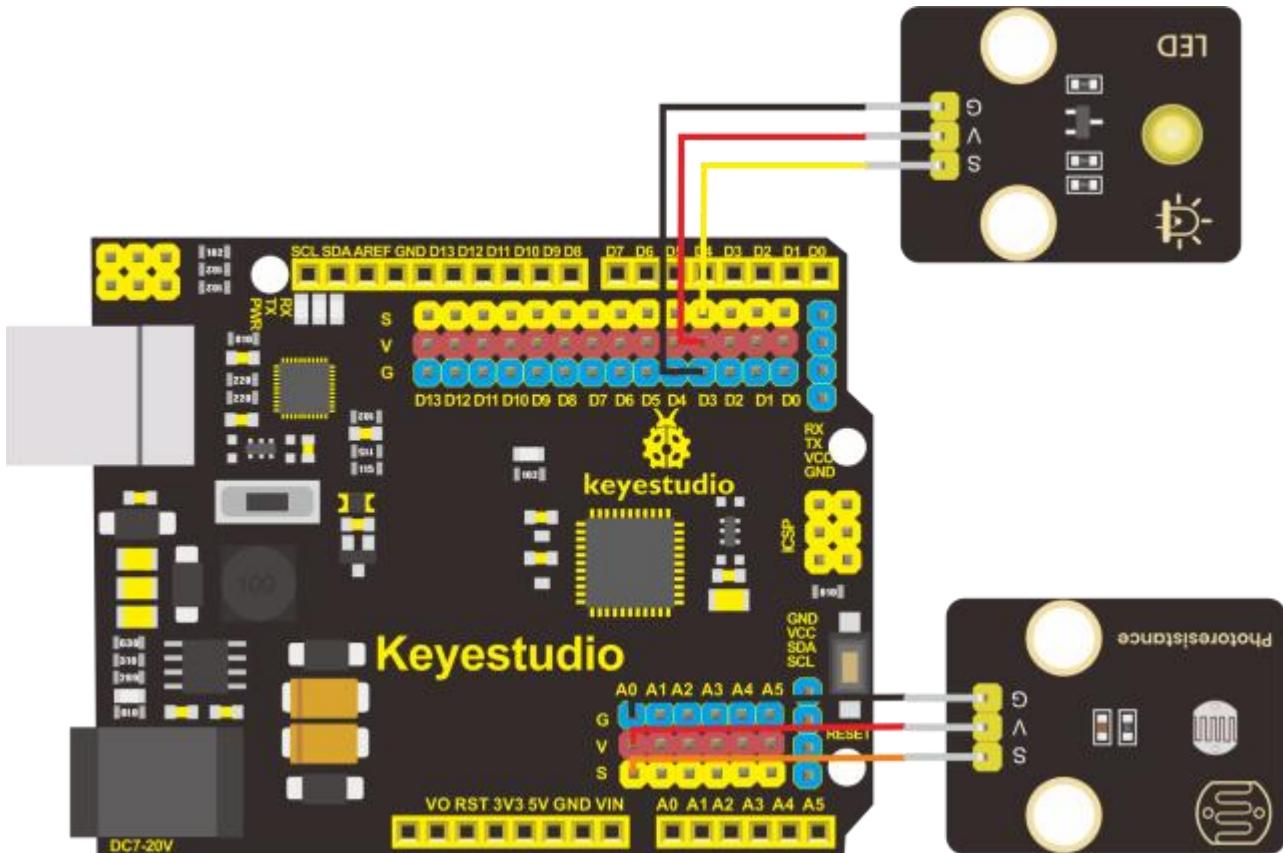

(3) You need to prepare:

| Control Board*1 | USB Cable*1 | Yellow LED Module*1 | 3pin DuPont Wire*2 | Push Button Module*4 |
|-----------------|-------------|---------------------|--------------------|----------------------|
| | | | | |

(4) Connection Diagram:

| Pin Connection Table | |
|----------------------|----------------------|
| Pin of Photoresistor | Pin of Control Board |
| G | G/A0 |
| V | V/A0 |
| S | S/A0 |

| Pin Connection Table | |
|----------------------|----------------------|
| Pin of the LED | Pin of Control Board |
| G | G/D3 |
| V | V/D3 |
| S | S/D3 |

1. Connect the control board to the computer with the usb cable.

2. Open the INO file inside the **lesson_6** folder with Arduino IDE.

```

lesson_4_2
lesson_5
lesson_6
lesson_7

```

3. Click the board selector or tool menu to "**Arduino UNO**" and **COM-XX**

4. Click upload >>>done uploading.

File Edit Sketch Tools Help

lesson_6.ino

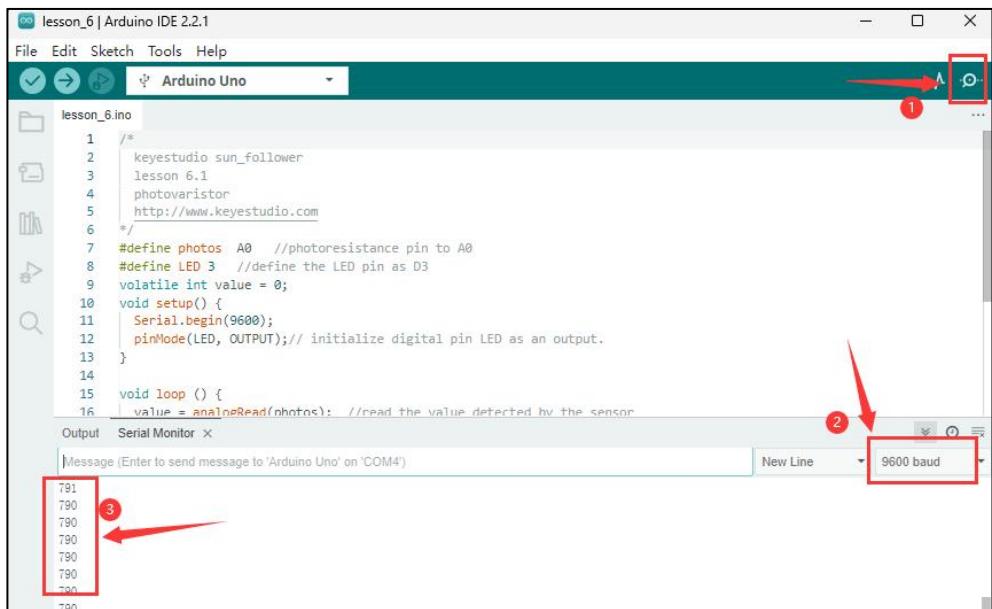

```

1  /*
2   * keyestudio sun_follower
3   * lesson 6.1
4   * photovaristor
5   * http://www.keyestudio.com
6   */
7 #define photos A0 //photoresistance pin to A0
8 #define LED 3 //define the LED pin as D3
9 volatile int value = 0;
10 void setup() {
11   Serial.begin(9600);
12   pinMode(LED, OUTPUT); // initialize digital pin LED as an output.
13 }
14
15 void loop () {
16   value = analogRead(photos); //read the value detected by the sensor
17   Serial.println(value);
18 }

```

Test Results: After the code has been successfully uploaded, keep powering the control board from the computer using the USB cable.

1) Click to open the serial monitor, set the baud rate to 9600, the serial monitor will print the value detected by the photosensitive sensor.

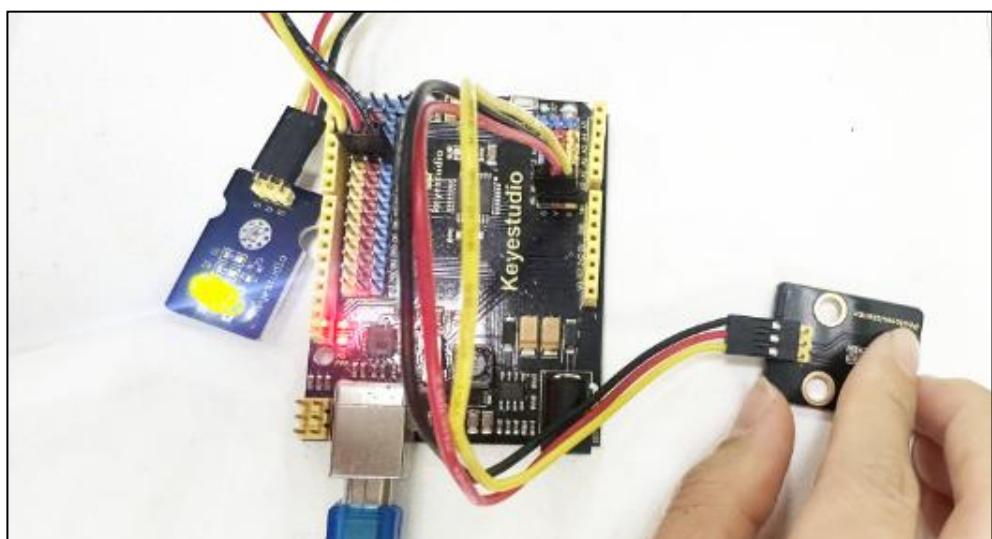

The screenshot shows the Arduino IDE interface with the sketch named "lesson_6.ino". The code is as follows:

```
/*
 * keyestudio sun_follower
 * lesson 6.1
 * photovaristor
 * http://www.keyestudio.com
 */
#define photos A0 //photoresistance pin to A0
#define LED 3 //define the LED pin as D3
volatile int value = 0;
void setup() {
  Serial.begin(9600);
  pinMode(LED, OUTPUT); // initialize digital pin LED as an output.
}
void loop () {
  value = analogRead(photos); //read the value detected by the sensor
}
```

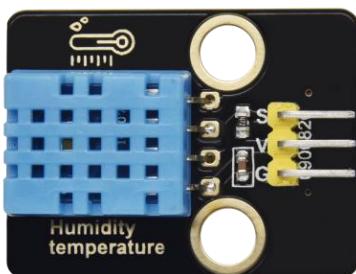

The "Serial Monitor" window is open, showing the output: "Message (Enter to send message to 'Arduino Uno' on 'COM4')". The baud rate is set to "9600 baud". The output text area contains the value "790" repeated multiple times. A red arrow labeled "3" points to the third "790" entry, and another red arrow labeled "2" points to the "9600 baud" setting.

2) Change the light intensity around the photosensitive sensor with your finger or palm and you will notice that the LED module will light up when the light value checked by the photosensitive sensor is lower than 300.

There are 4 photosensitive sensors included in this kit, please go one by one to check if it works properly.

Lesson 7: DHT11 Temperature and Humidity Sensor

(1)Description:

This DHT11 temperature and humidity sensor is a composite sensor which contains a calibrated digital signal output of the temperature and humidity.

DHT11 temperature and humidity sensor uses the acquisition technology of the digital module and temperature and humidity sensing technology, ensuring high reliability and excellent long-term stability.

It includes a resistive element and a NTC temperature measuring device.

(2)Parameters:

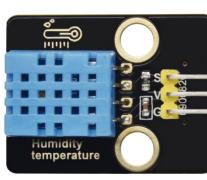

Working voltage: +5 V

Working temperature: 0-50 °C error of ± 2 °C

Humidity: 20-90% RH ± 5 % RH error

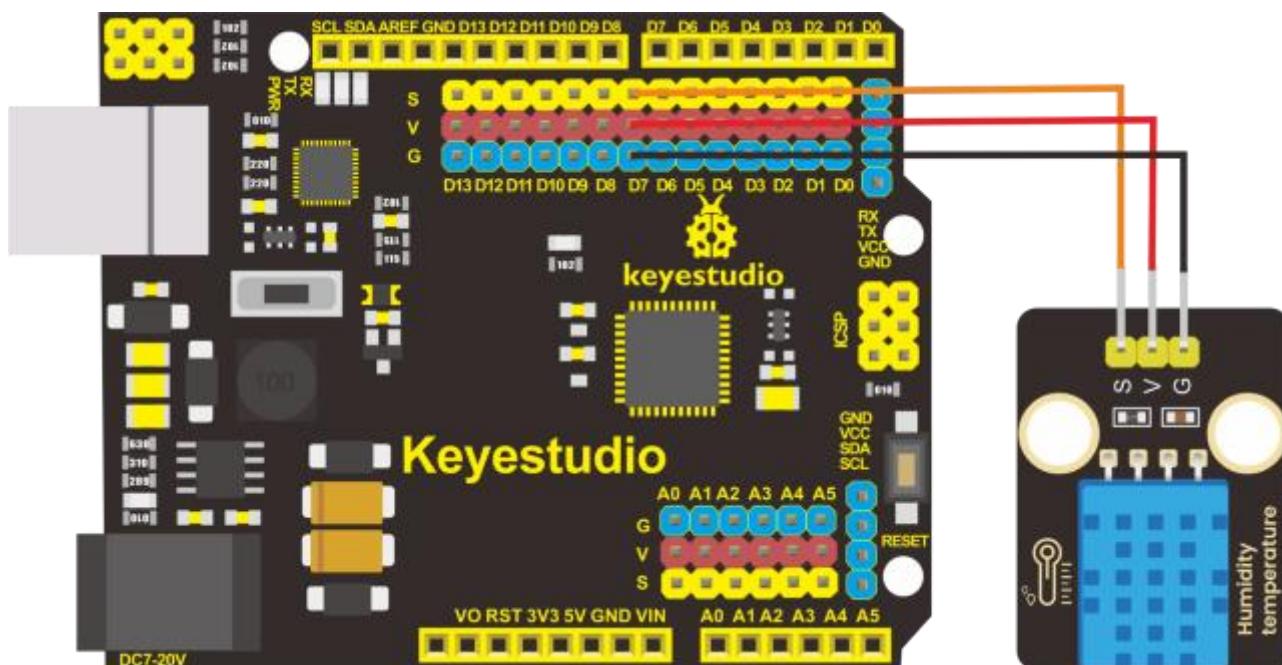

Interface: digital port

(5) You need to prepare:

| Control Board*1 | USB Cable*1 | DHT11 Sensor*1 | 3pin DuPont Wire |
|---|---|--|---|
|  |  |  |  |

(4)Connection Diagram

The G, V and S pins of DHT11 Sensor*1 are connected to G, V and D7 of the control Board.

1. Connect the control board to the computer with the USB cable.
2. Open the INO file inside the **lesson_7** folder with Arduino IDE.

Note: Before uploading the code, make sure you have installed the **<Dht11.h>** library files.

3. Click the board selector or tool menu to "Arduino UNO" and **COM-XX**

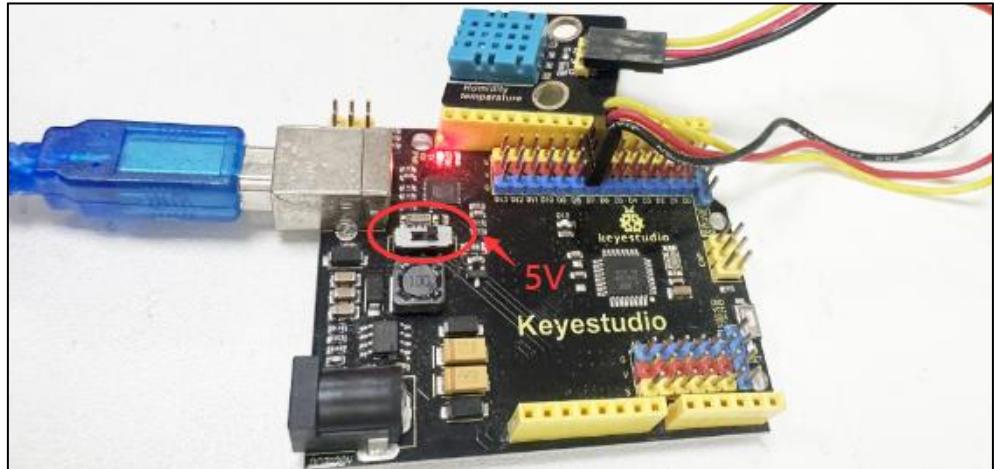

4. Click upload >>> done uploading.

```

```

Lesson 8: BH1750 Digital Light Intensity Module

The main component of this sensor is chip BH1750FVI which is an integrated chip for digital light intensity.

As shown in the picture below, BH1750 is composed of a photodiode, an operational amplifier, an ADC acquisition, a crystal oscillator, etc. The photodiode converts the input optical signal into an electrical signal through the photovoltaic effect. After being amplified by the operational amplifier circuit, the voltage is collected by the ADC, and then converted into a 16-bit binary number through the logic circuit and stored in the internal register (Note: The stronger the light, the greater the photocurrent, and the greater the voltage, so the intensity of the light can be judged by the value of the voltage).

However, it should be noted that the voltage and the light intensity are one-to-one correspondence, but not proportional. That is why this chip linear processing is done and why the integrated IC is used directly instead of photodiodes). BH1750 leads out the clock line and data line. The single-chip microcomputer can communicate with the BH1750 module through the I2C protocol. You can choose the working mode of the BH1750, or you can extract the illuminance data of the BH1750 register.

(2)Parameters:

I2C digital interface, supporting a maximum rate of 400Kbps

The output is Illuminance

Measuring range is 1~65535 lux, the minimum resolution is 1lux

Low power consumption (Power down) function

Shield the interference of light changes caused by 50/60Hz mains frequency

Supports two I2C addresses, selected by the ADDR pin

Small measurement deviation(maximum accuracy error +/-20%)

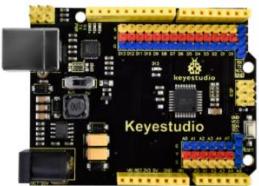

GND power ground

SDA I2C bus data pin

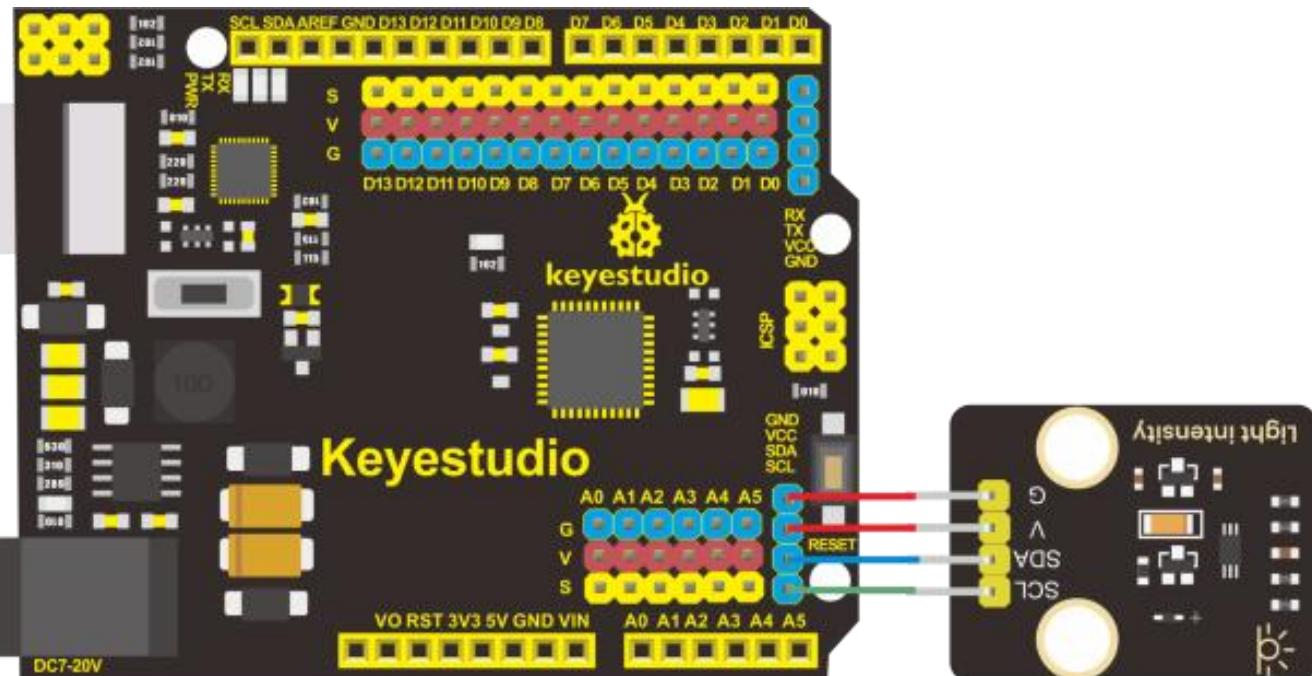

SCL I2C bus clock pin

VCC power supply voltage 3-5V

(3) You need to prepare:

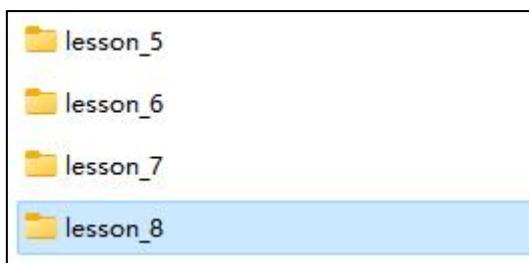

| Control Board*1 | USB Cable*1 | BH1750FVI Sensor*1 | 350mm 4pin F-F Wire |
|---|---|--|---|
|  |  |  |  |

(4) Connection Diagram:

1. Connect the control board to the computer with the usb cable.

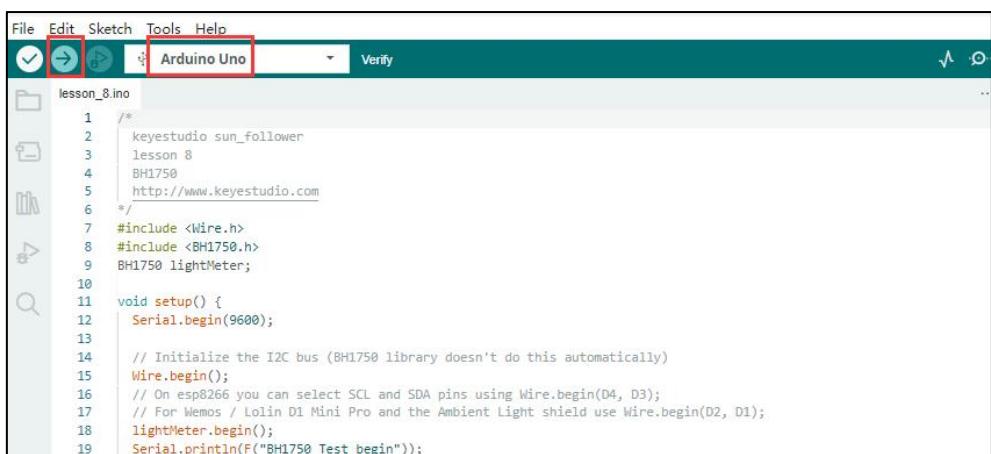

2. Open the INO file inside the **lesson_8** folder with Arduino IDE.

Note: Before uploading the code, make sure you have installed the **<BH1750.h>** and **<Wire.h>** library files.

3. Click the board selector or tool menu to "Arduino UNO" and **COM-XX**

4. Click upload >>>done uploading.

```

File Edit Sketch Tools Help
Arduino Uno Verify
lesson_8.ino
1  /*
2   keyestudio sun_follower
3   lesson 8
4   BH1750
5   http://www.keyestudio.com
6 */
7 #include <Wire.h>
8 #include <BH1750.h>
9 BH1750 lightMeter;
10
11 void setup() {
12   Serial.begin(9600);
13
14   // Initialize the I2C bus (BH1750 library doesn't do this automatically)
15   Wire.begin();
16
17   // On esp8266 you can select SCL and SDA pins using Wire.begin(D4, D3);
18   // For Wemos / Lolin D1 Mini Pro and the Ambient Light shield use Wire.begin(D2, D1);
19   lightMeter.begin();
20   Serial.println(F("BH1750 Test begin"));

```

Test Results: After the code has been successfully uploaded, keep powering the control board from the computer using the USB cable.

Click to open the serial monitor to set the baud rate to 9600, the serial monitor prints the value of the ambient light intensity(unit: lux). When the light source gets weaker, the value becomes smaller.

The screenshot shows the Arduino IDE interface. The top menu bar includes File, Edit, Sketch, Tools, Help, and an Arduino Uno dropdown. A red arrow labeled '1' points to the power icon in the top right corner. The code editor window contains 'lesson_8.ino' with code for a sun-follower project using a BH1750 light meter. The Serial Monitor window at the bottom shows the output: 'Light: 10.00 lx', 'Light: 10.83 lx', 'Light: 10.83 lx', 'Light: 11.67 lx', 'Light: 10.83 lx', 'Light: 9.17 lx', and 'Light: 9.17 lx'. A red box highlights the output text, and a red arrow labeled '3' points to it. Another red arrow labeled '2' points to the '9600 baud' dropdown menu in the Serial Monitor header. The status bar at the bottom right indicates 'Ln 8, Col 10' and 'Arduino Uno on COM4'.

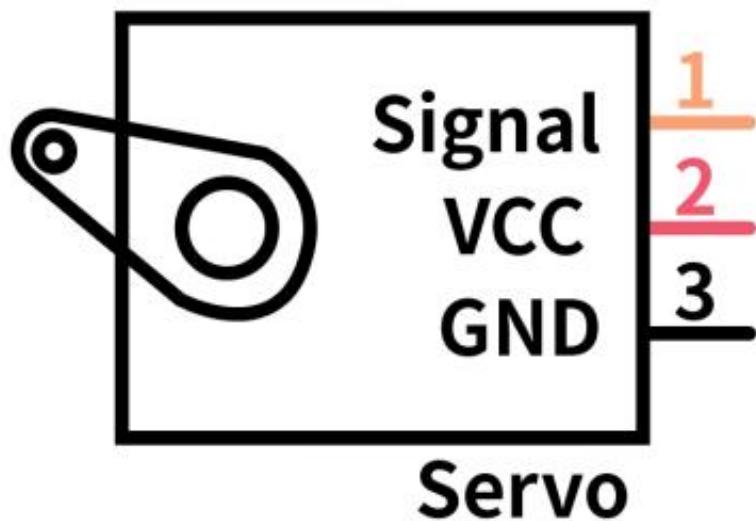

(**Note:** since the I2C bus can have multiple devices with different addresses, when the digital light intensity module is used together with the I2C LCD1602 module, there is no conflict because they have different addresses.)

Lesson 9: Test the Servo Motor

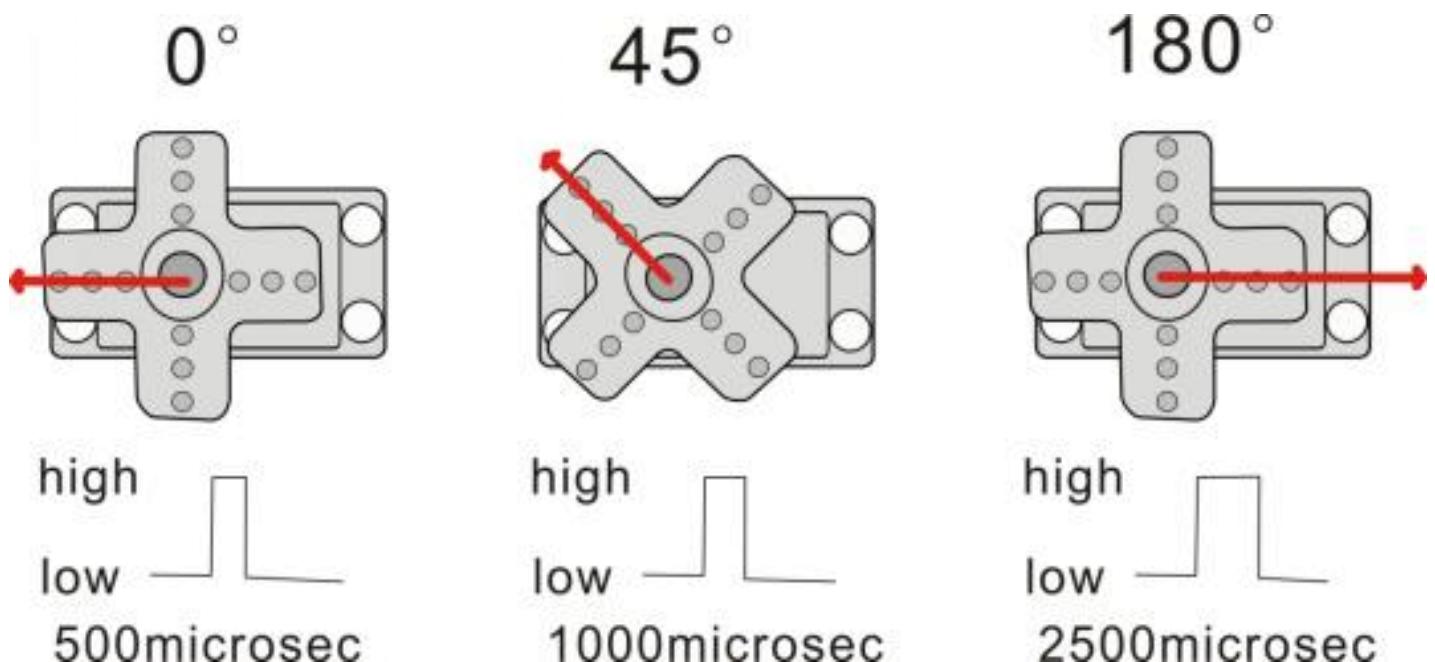

(1)Description:

Servo motor is a position control rotary actuator. It mainly consists of housing, circuit board, core-less motor, gear and position sensor. Its working principle is that the servo receives the signal sent by MCU or receiver, and produces a reference signal with a period of 20ms and width of 1.5ms, then compares the acquired DC bias voltage to the voltage of the potentiometer and obtains the voltage difference output.

For the servo used in this project, the brown wire is the ground, the red one is the positive wire, and the orange one is the signal wire.

The rotation angle of servo motor is controlled by regulating the duty cycle of PWM (Pulse-Width Modulation) signal. The standard cycle of PWM signal is 20ms(50Hz). Theoretically, the width is distributed between 1ms-2ms, but in fact, it's between 0.5ms-2.5ms. The width corresponds to the rotation angle from 0° to 180°. But note that for different brand motor, the same signal may have different rotation angle.

More details:

| High level time | Servo angle |
|-----------------|-------------|
| 0.5ms | 0 degree |
| 1ms | 45 degree |
| 1.5ms | 90 degree |
| 2ms | 135 degree |
| 2.5ms | 180 degree |

(2)Parameters:

Working voltage: DC 4.8V ~ 6V

Operating angle range: about 180 ° (at 500 → 2500 µsec)

Pulse width range: 500 → 2500 µsec

No-load speed: 0.12 ± 0.01 sec / 60 (DC 4.8V) 0.1 ± 0.01 sec / 60 (DC 6V)

No-load current: 200 ± 20 mA (DC 4.8V) 220 ± 20 mA (DC 6V)

Stopping torque: 1.3 ± 0.01 kg · cm (DC 4.8V) 1.5 ± 0.1 kg · cm (DC 6V)

Stop current: ≤ 850 mA (DC 4.8V) ≤ 1000 mA (DC 6V)

Standby current: 3 ± 1 mA (DC 4.8V) 4 ± 1 mA (DC 6V)

Lead length: 250 ± 5 mm

Appearance size: 22.9 * 12.2 * 30mm

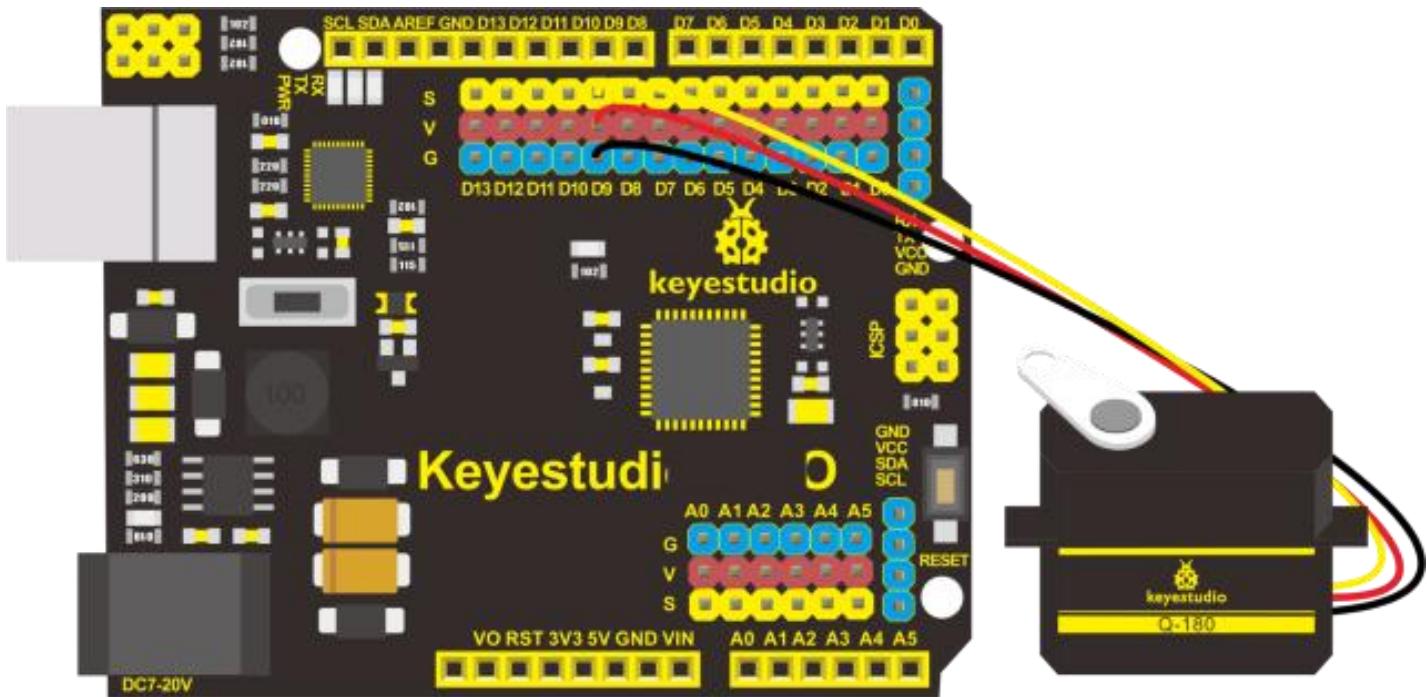

Weight: 9 ± 1 g (without servo horn)

(3) You need to prepare:

| Control Board*1 | USB Cable*1 | Servo*2 |
|---|---|---|
|  |  |  |

(4)Connection Diagram

Note: The servo is connected to G (GND), V (VCC), D9. The brown wire is connected to Gnd (G), the red wire is connected to (V), and the orange wire is connected to digital pin D9.

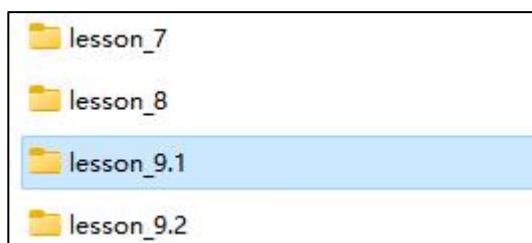

We will introduce two ways to control the servos, one without using the [**<Servo.h>**](#) library file and one with the [**<Servo.h>**](#) library file.

9.1 Not using the [**<Servo.h>**](#) library to control the servo

1. Connect the control board to the computer with the usb cable.

2. Open the INO file inside the [**lesson_9.1**](#) folder with Arduino IDE.

3. Click the board selector or tool menu to "[**Arduino UNO**](#)" and [**COM-XX**](#)

4. Click upload >>>done uploading.

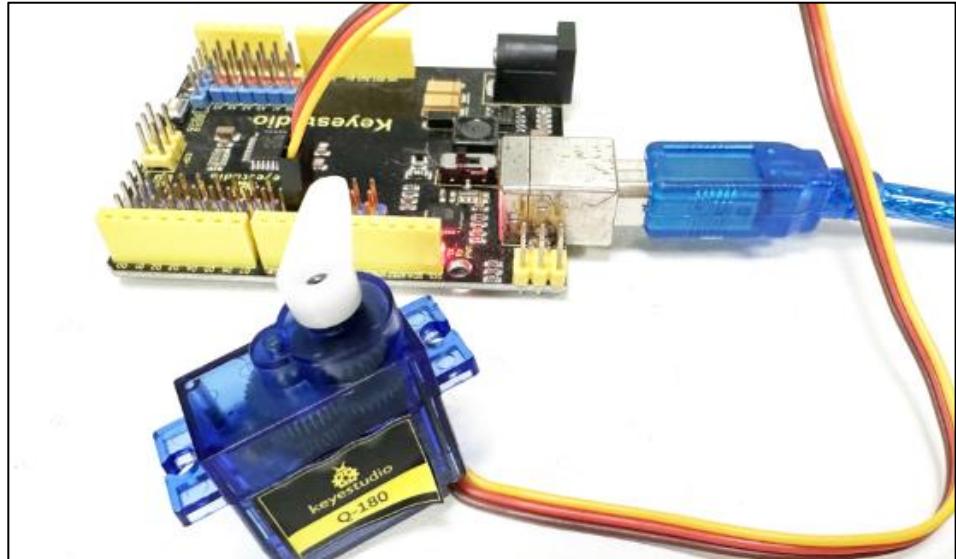

```

lesson_9.1.ino
1  /*
2   keyestudio sun_follower
3   lesson 9.1
4   servo
5   http://www.keyestudio.com
6  */
7  int servoPin = 9; //set the pin of the servo
8
9  void setup() {
10  pinMode(servoPin, OUTPUT); //set the pin of the servo
11 }
12 void loop() {
13  servopulse(servoPin, 0); //rotate to 0 degree
14  delay(1000); //delay in 1s
15  servopulse(servoPin, 90); //rotate to 90 degrees

```

Test Results: After uploading the code, the servo will cycle from 0° to 90° and then to the 180° position.

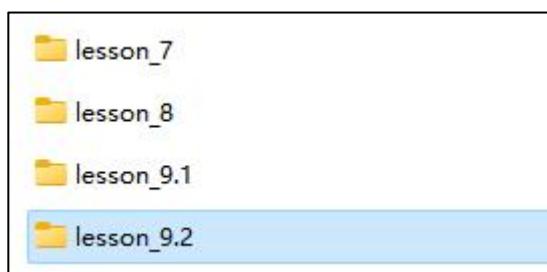

To be able to visualise the change in angle of the Servo, you can attach a plastic arm to the Servo shaft.

9.2 Using the <Servo.h> library to control the servo

1. Connect the control board to the computer with the usb cable.

2. Open the INO file inside the **lesson_9.2** folder with Arduino IDE.

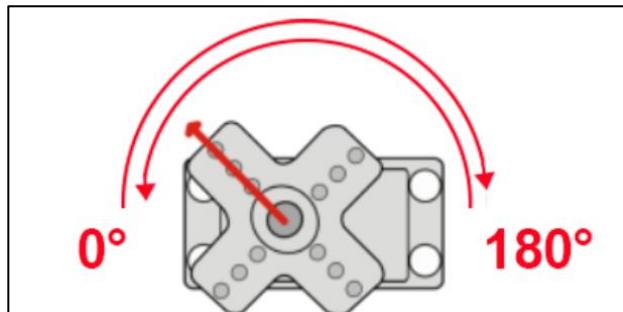

3. Click the board selector or tool menu to "**Arduino UNO**" and **COM-XX**

4. Click upload >>>done uploading.

```

7 #include <Servo.h> //include the library code:
8 Servo myservo;
9
10 void setup() {
11   myservo.attach(9); //link the servo to digital port 9
12 }
13
14 void loop () {
15   //rotate from 0 degree to 180 degrees
16   for (int i = 0; i < 180; i++) {
17     myservo.write(i);
18     delay(20);
19   }
20   delay(1000); //wait for 1s
21
22   //rotate from 180 degree to 0 degree
23   for (int i = 180; i > 0; i--) {
24     myservo.write(i);
25     delay(20);
26 }
```

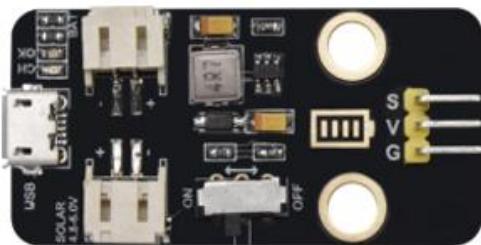

A screenshot of the Arduino IDE showing the code for 'lesson_9.2.ino'. The code includes the Servo library, initializes a servo on pin 9, and creates a loop that rotates the servo from 0 to 180 degrees and back again, with a 1-second delay between rotations.

Test Results: After uploading the code, the servo rotates from 0 degree to 180 degree, from 180 degree to 0 degree.

Lesson 10: Charging Principle of the Solar Tracking Kit

(1) Solar and usb charging module:

This module integrates a charging and discharging chip, which can be connected with an external rechargeable battery and a solar panel through the PH2.0MM interfaces.

In this kit, we provide a battery box that holds one 18650 battery, so you will need to prepare a rechargeable 18650 battery yourself.

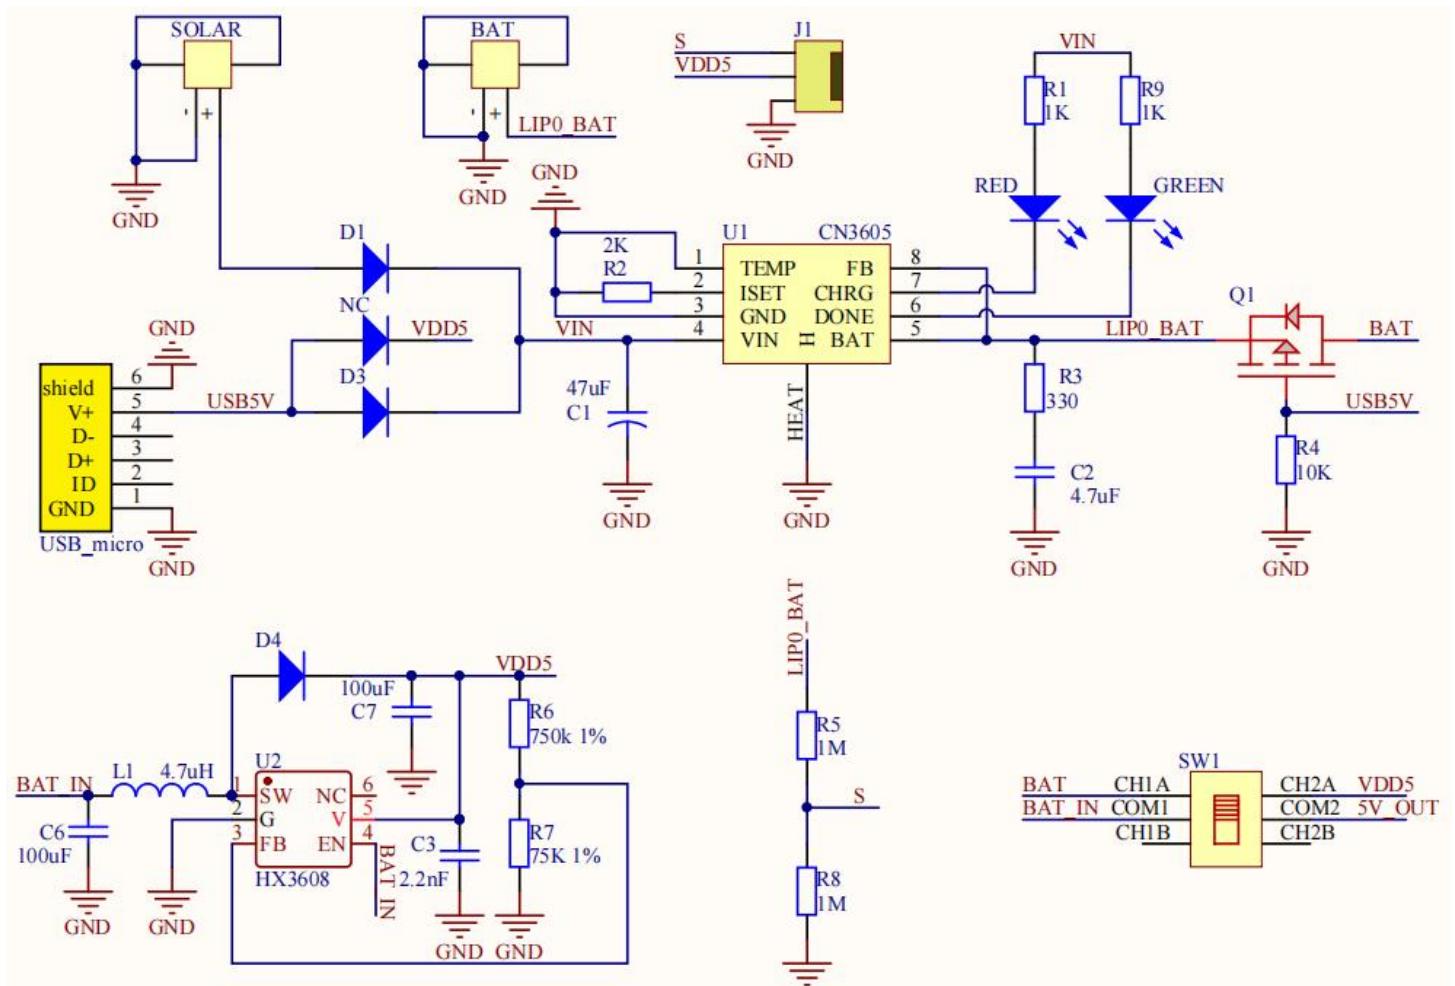

The module has a Micro USB port and you can use the computer to charge the 18650 battery through the micro USB port.

In addition, it has a boost module which can increase the voltage of batteries to 6.6V. The DIP switch on the module is the OUTPUT switch of 6.6V. The pin G and V of this module can output 6.6V and the pin S can read the battery voltage after the resistance 1/2 voltage.

Parameters:

| | |
|--|--|
| Charging Interface | 1. Micro USB 2. HP2.0MM Interface for Solar Panel |
| Input voltage of the solar panel interface | 4.4-6V |
| Constant voltage charging value of the battery | 4.15-4.24V |
| Maximum charging current | 800mA |
| Output interface | 3 P 2.54mm Bent Needle |
| Input Voltage | 6.6V |
| Maximum output current | 1A |
| External Battery | 18650 battery |
| Environmental attributes | ROHS |

Schematic Diagram

Features

① SOLAR4.8-6.0V interface

It is connected to the solar panel and can power the control board and charge the battery.

② BAT interface

It can be connected to the battery case we provided and charge the battery.

③ Micro USB Port

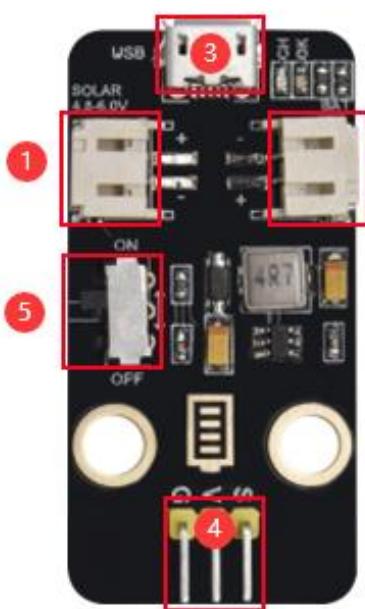

This interface allows you to use the USB cable to power the control board and charge the battery.

④ Power output pin

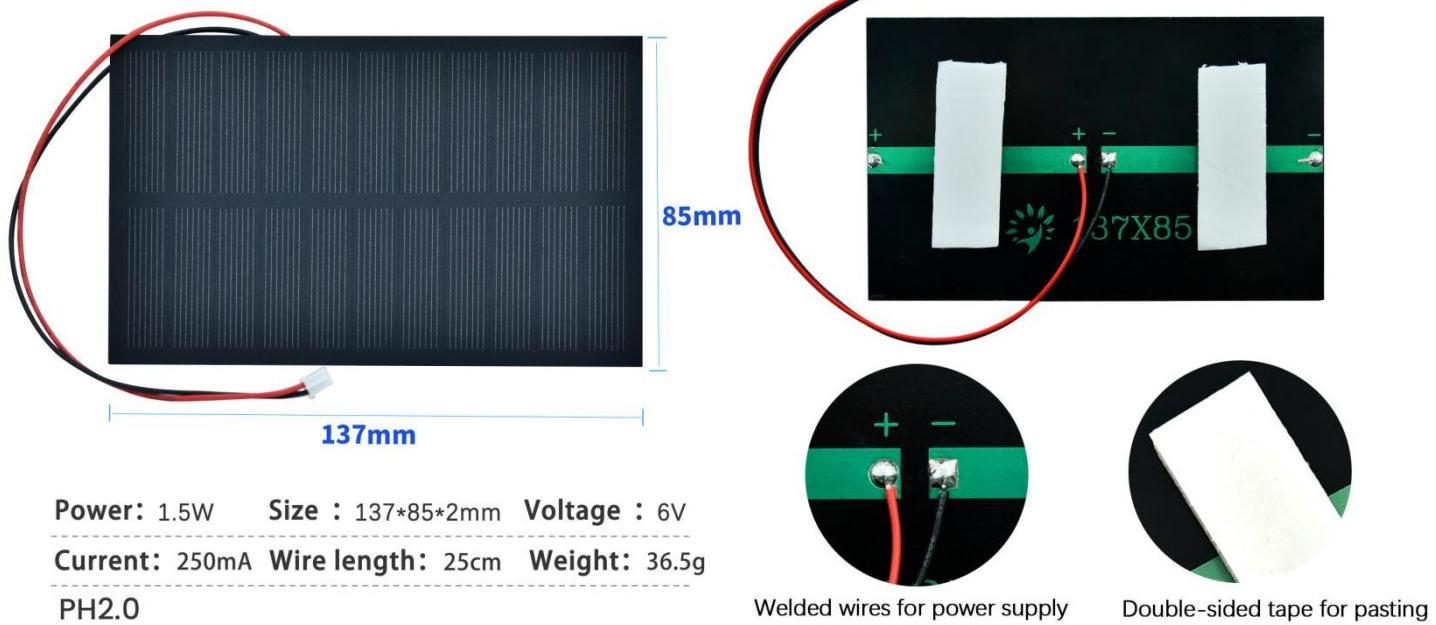

It can power the control board through the 20cm M to F DuPont Wire. G is connected to the GND of the control board, and V is connected to the VIN of the control board.

⑤ Power switch

This is the switch that controls power to the control board. Turn it off, the **④ power out pin** will lose power output.

(2)PET Solar Panel

The main factors that affect the output performance of solar panels are as follows:

- (1) Load impedance
- (2) Sunlight intensity
- (3) Temperature
- (4) Illumination angle and illumination area

You can use a multimeter to measure the output current of the solar panel, adjust the multimeter to DC current level and large range jack, connect the red pen of the multimeter to the positive pole of the solar panel and the black pen to the negative pole of the solar panel, and measure it.

Can solar panels store electricity?

No, generally it needs to be paired with a battery to store electricity.

Can solar panels generate electricity on cloudy days?

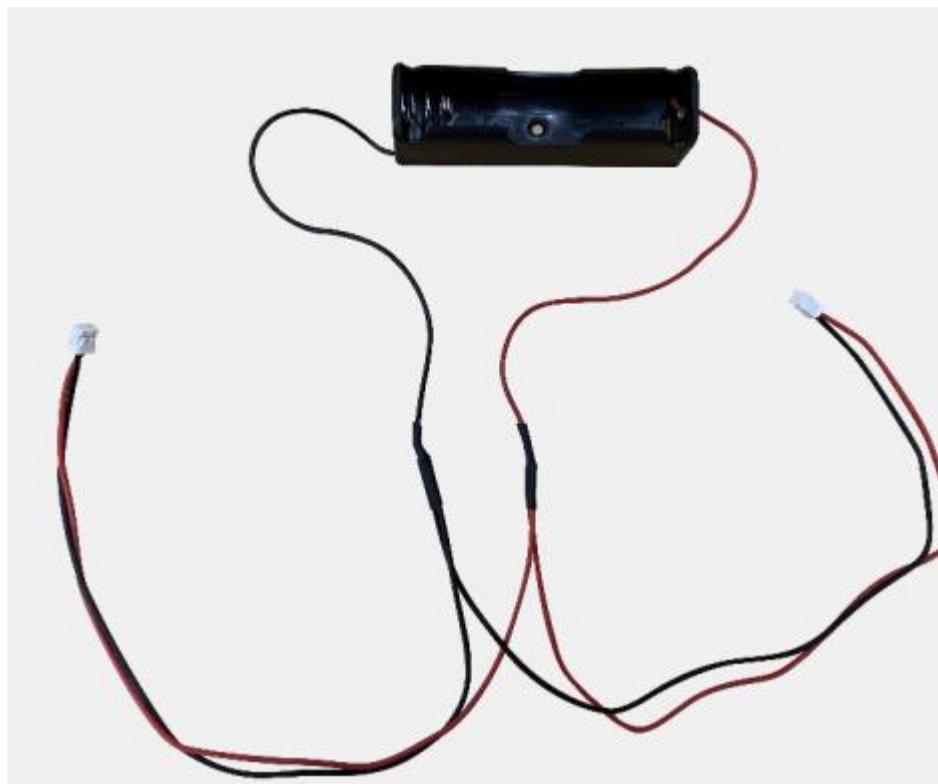

No, the power generated by solar panels on cloudy days is very small. In this case, they have voltage but no current.

Can solar panels generate electricity under indoor lighting?

No, solar panels cannot generate electricity under indoor lighting.

(3) Charge the battery with the solar panel.

In this kit, we provide a battery case that is compatible with one 18650 battery, and it is also configured with two interfaces so that you can charge the battery or use it for power.

2. You will need to prepare yourself a 18650 battery as well as a battery charger.

The following parameters are available for your purchase:

| Specifications | |
|---------------------------|-----------------|
| Size | 18650 |
| Positive Terminal: | with a top |
| Capacity | >2200mAh |
| Nominal Voltage | 3.7V |
| Maximum Voltage | 4.2V |
| Discharge cut-off Voltage | 2.5V |
| Rechargeable | Yes |
| Approx. Dimensions | 18.5mm x 65.2mm |

We can connect the solar panel to the charging module and a 18650 lithium case, so that the solar panel will charge the battery.

Solar panels are not batteries, do not have the function of power storage. It can store electricity in the batter.

The output of solar panels is weak in environments where there is no sunlight, indoor lighting and low winter light. The energy carried by these lights is very small, even if it is brighter.

Note:

The solar panel may require long periods of direct sunlight to charge the batteries enough. 18650 batteries should not be exposed to direct sunlight as well as avoiding high temperatures around it to avoid burnout.

(5)Smart phone charging Module

The mobile phone charging module is a lithium battery boost module of 3.7V which can output 5V, 1A through the PH2.0 terminal and USB port.

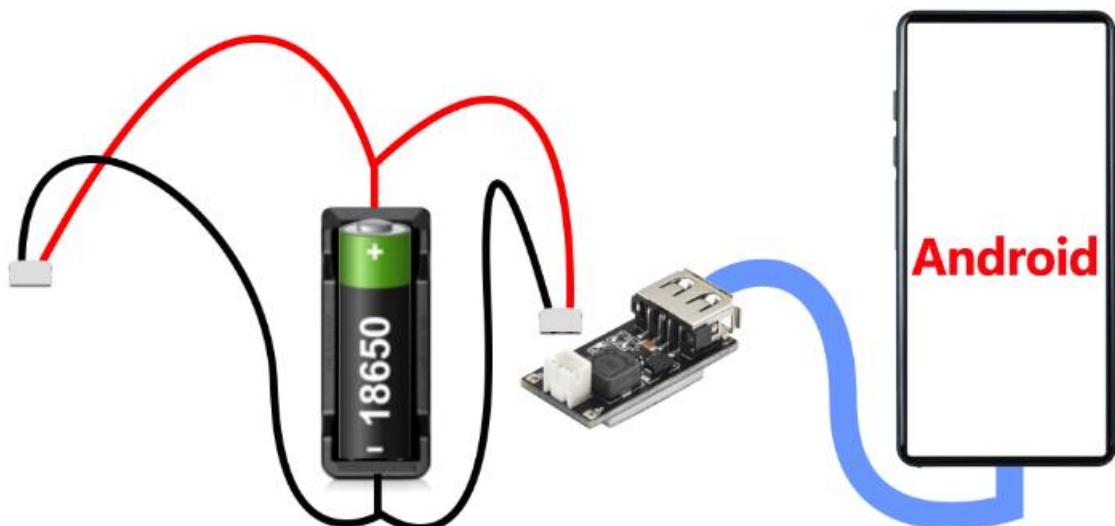

Parameters:

| | |
|-----------------------|--|
| Property | non-isolated boost module (BOOST) |
| Input voltage | 1-5V |
| Output voltage | 5 ± 0.1V |
| Output current: | Rated 1-1.5A (single cell lithium battery input), maximum 1.5A (single cell lithium battery input) |
| Conversion efficiency | Up to 96% . |
| Switching frequency | 500KHz . |
| Working temperature | industrial grade (-40° C to +85° C) |
| Full load heating | 30° C |
| Quiescent current | 130uA |

PH2.0 terminal of the phone charging module can be connected to the battery case.

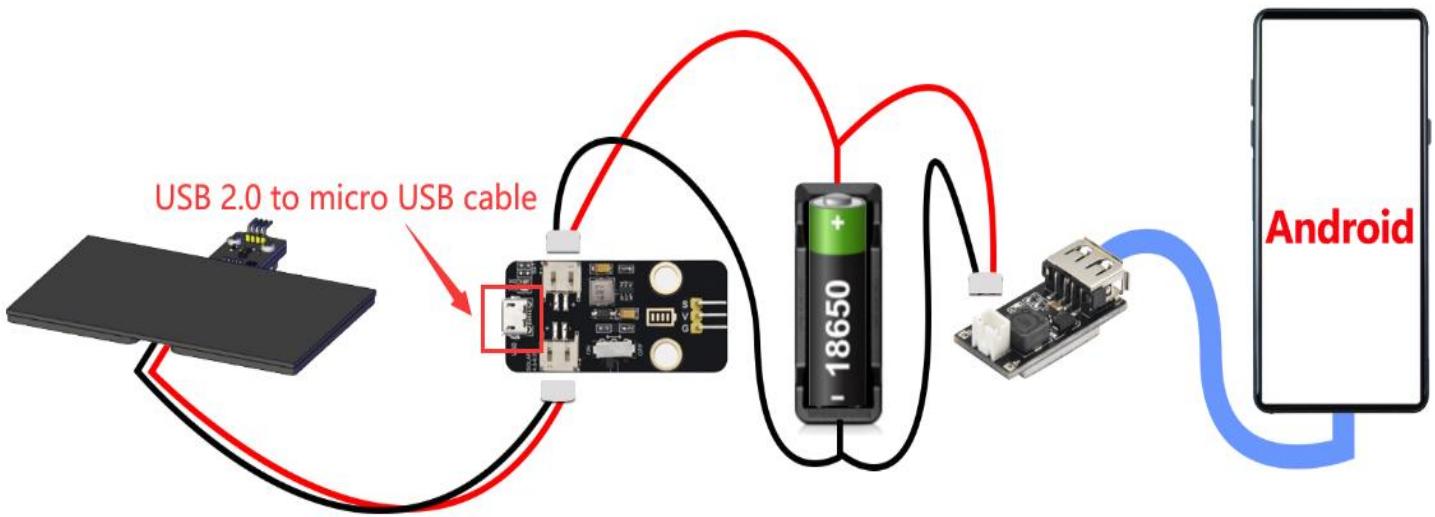

The USB port of it can be connected to an android phone and charged.

Note that the power of 18650 battery must be sufficient (voltage up to 3.2-4.2V) to charge an Android phone. Otherwise it does not work, even if the phone shows it is charging.

(6) Charging Principle of the Solar Tracking Kit

- 1、Maximum charging current of micro USB port 1A
- 2、Solar panel maximum charging current 80mA
- 3、Maximum output voltage of USB A port female holder: 5V/1.5A (can be used for mobile phone charging)
- 4、Battery type: 18650 lithium battery with a top, recommended to buy capacity greater than 2200mAh

Note:

- 1).The charging protocol of phone charging Module only **supports Android but not iOS**.
- 2).The solar panel can't charge mobile phones directly; it need to store electricity in a battery and the battery charge the phone.
- 3).The voltage of the 18650 battery needs to be in the range of 3.2---4.2V to charge the cell phone. When the voltage of the battery is less than 3.2V, even though the phone shows that it is charging, it is not actually charging.
- 4).The solar panel may require long periods of direct sunlight to charge the batteries enough. 18650 batteries should not be exposed to direct sunlight as well as avoiding high temperatures around it to avoid burnout.
- 5).If you want to charge your 18650 battery quickly, you can charge the battery using the 18650 dedicated charger. Or use a USB 2.0 to micro USB cable to connect the charging module and charge the battery using a computer or power supply. (**USB 2.0 to micro USB cable not included in kit**)
- 6).This is just a simulation experiment and will not meet your daily power needs, don't use it as your regular cell phone power source.

Assembling the Solar Tracking Kit

Things to note before assembly:

1. Before assembly, please tear off the protective film on the acrylic boards.

2. You will need to prepare yourself a 18650 battery as well as a battery charger.

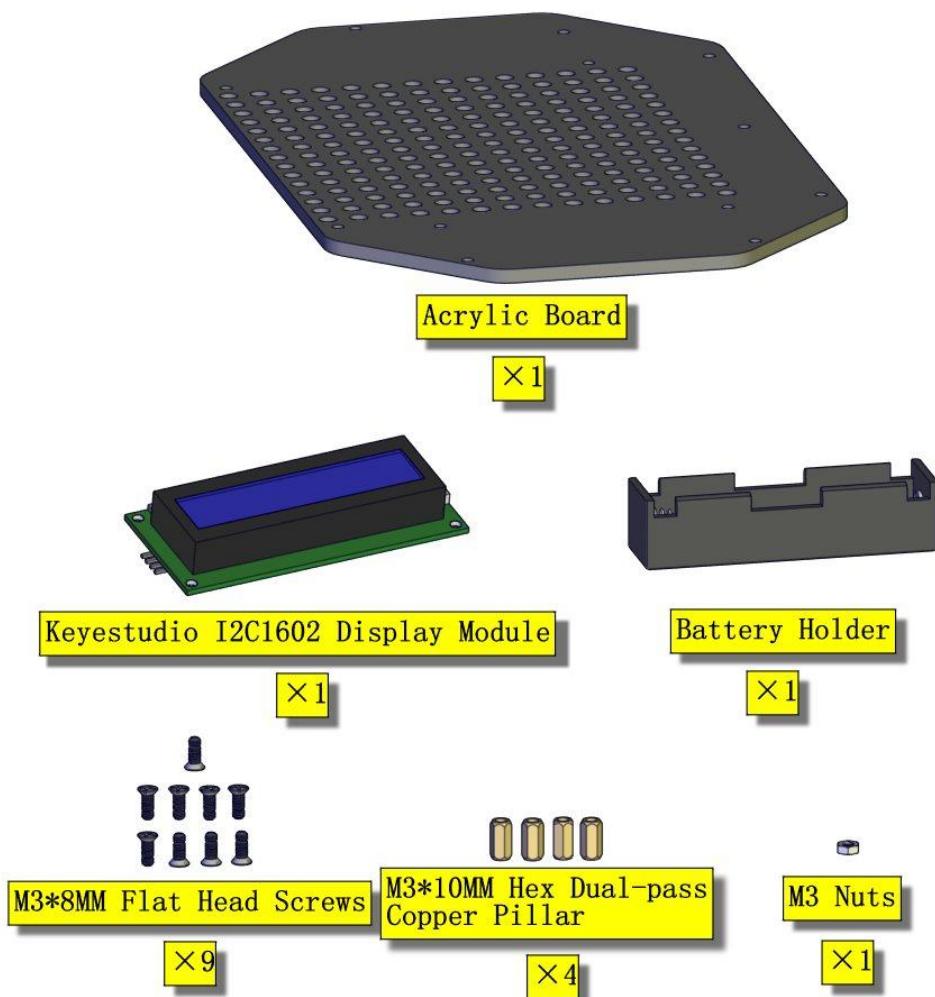

The following parameters are available for your purchase:

| Specifications | |
|---------------------------|-----------------|
| Size | 18650 |
| Positive Terminal: | with a top |
| Capacity | >2200mAh |
| Nominal Voltage | 3.7V |
| Maximum Voltage | 4.2V |
| Discharge cut-off Voltage | 2.5V |
| Rechargeable | Yes |
| Approx. Dimensions | 18.5mm x 65.2mm |

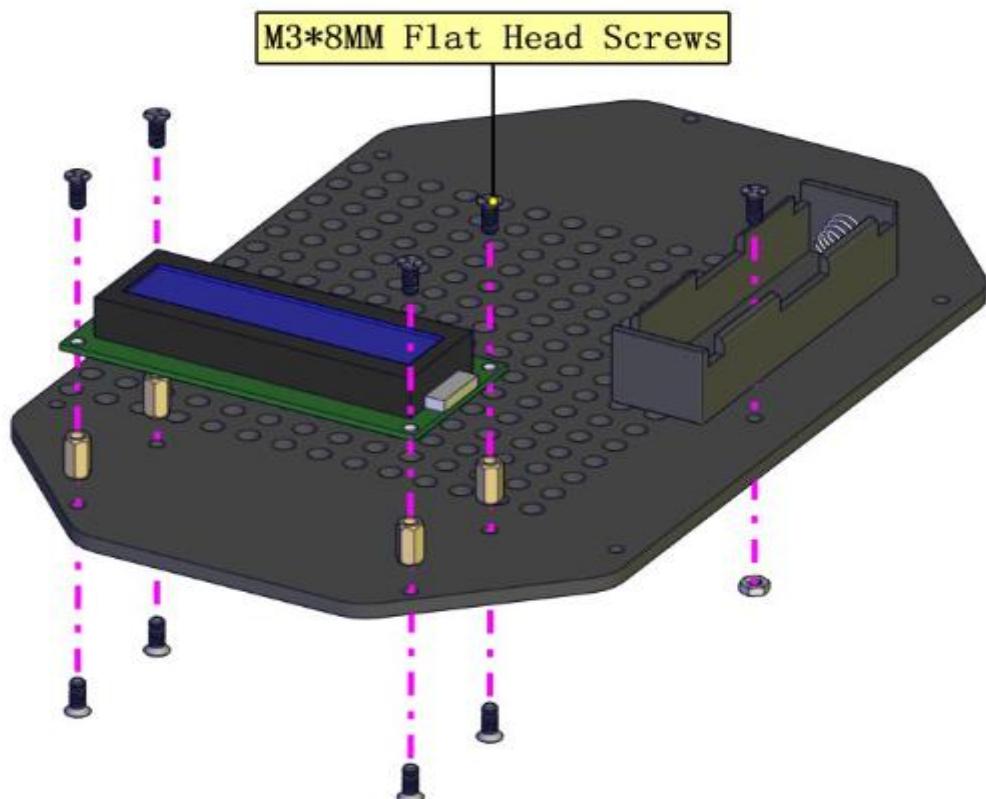

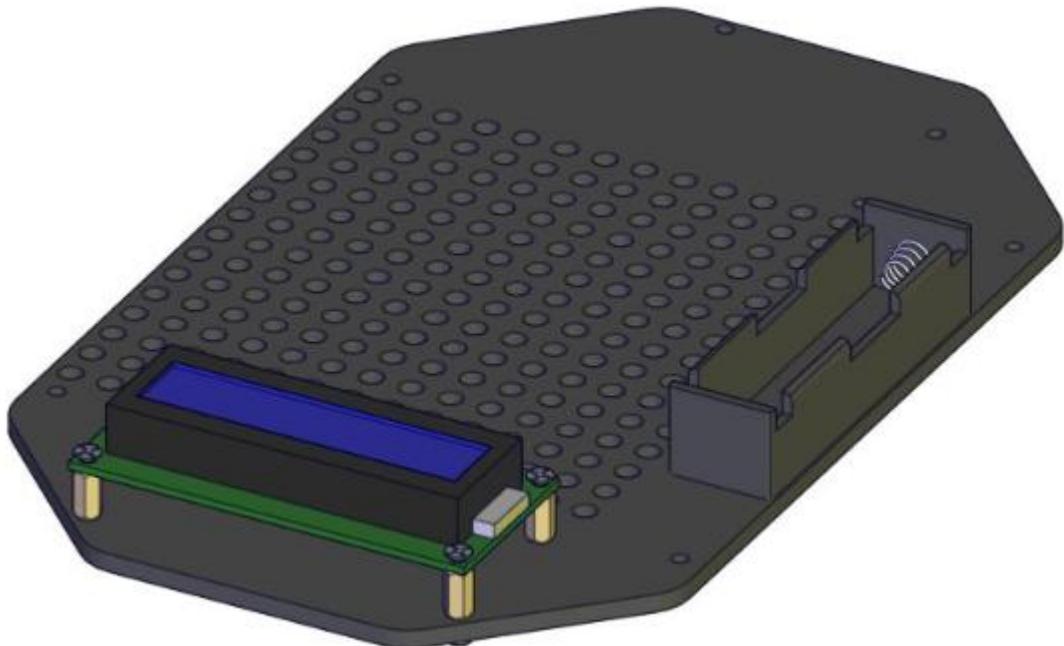

Part 1

Components Needed

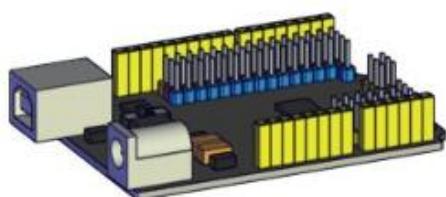

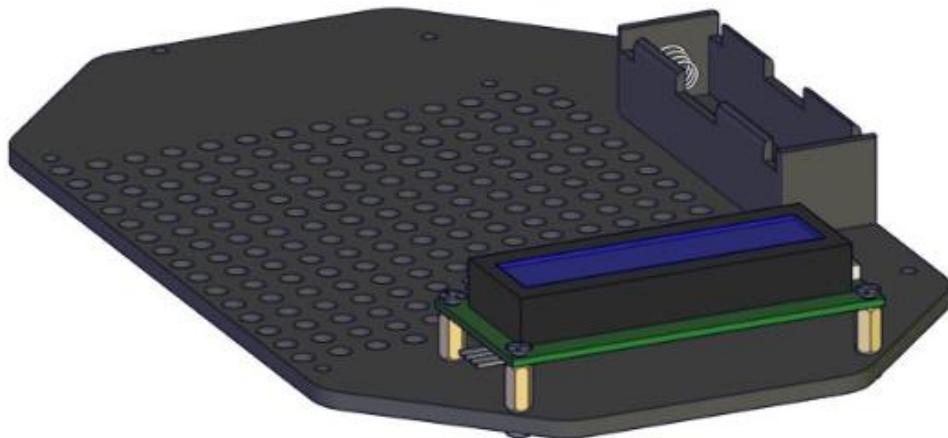

Assembling the 1602 display and battery box

Part 2

Components Needed

Keyestudio UNO
Control Board

Assembling the M3*45MM Copper Columns

Wiring the Lower Part Of The Kit

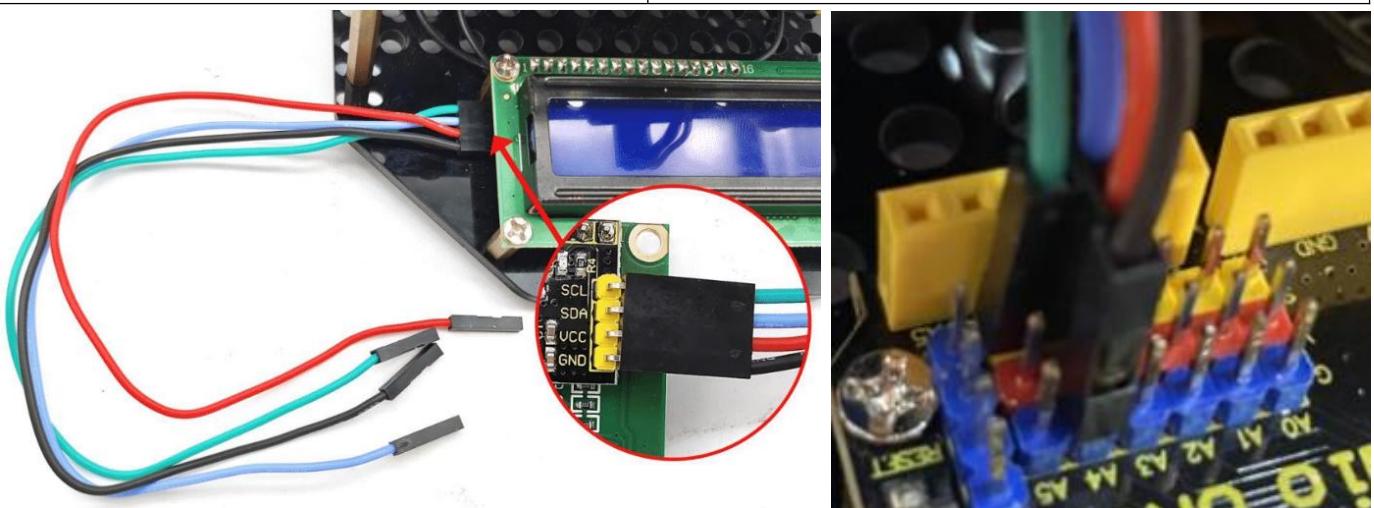

- 1) Use the 20cm M to F DuPont Wire to connect the Solar USB Charging Module to the uno control board. The G pin of the module is connected to the GND of UNO, the V pin of the module is connected to the Vin of UNO

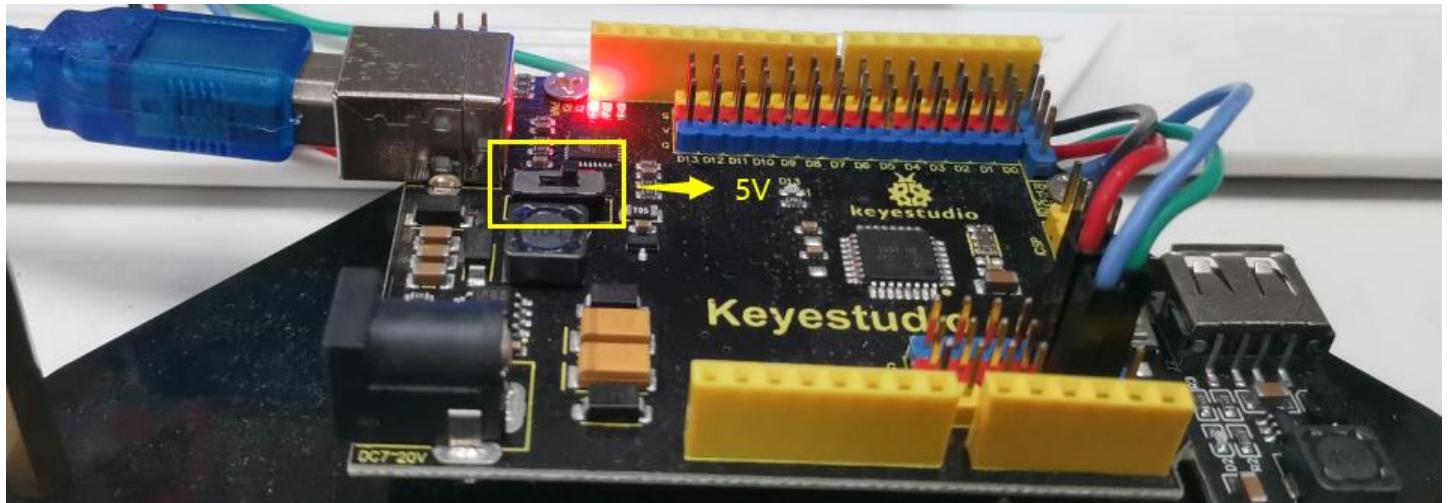

- 2) Connect the LCD display to the UNO board

Pin Connection Table

| Pin of the LCD Dispaly | Pin of Control Board |
|-------------------------------|----------------------|
| GND(black wire) | G/A4 |
| VCC(red wire) | V/A4 |
| SDA(blue wire) | S/A4 |
| SCL(green wire) | S/A5 |

Note: The working voltage of the LCD Display is 5V, please make sure the 3.3-5V Switch on the control board is dial to 5V.

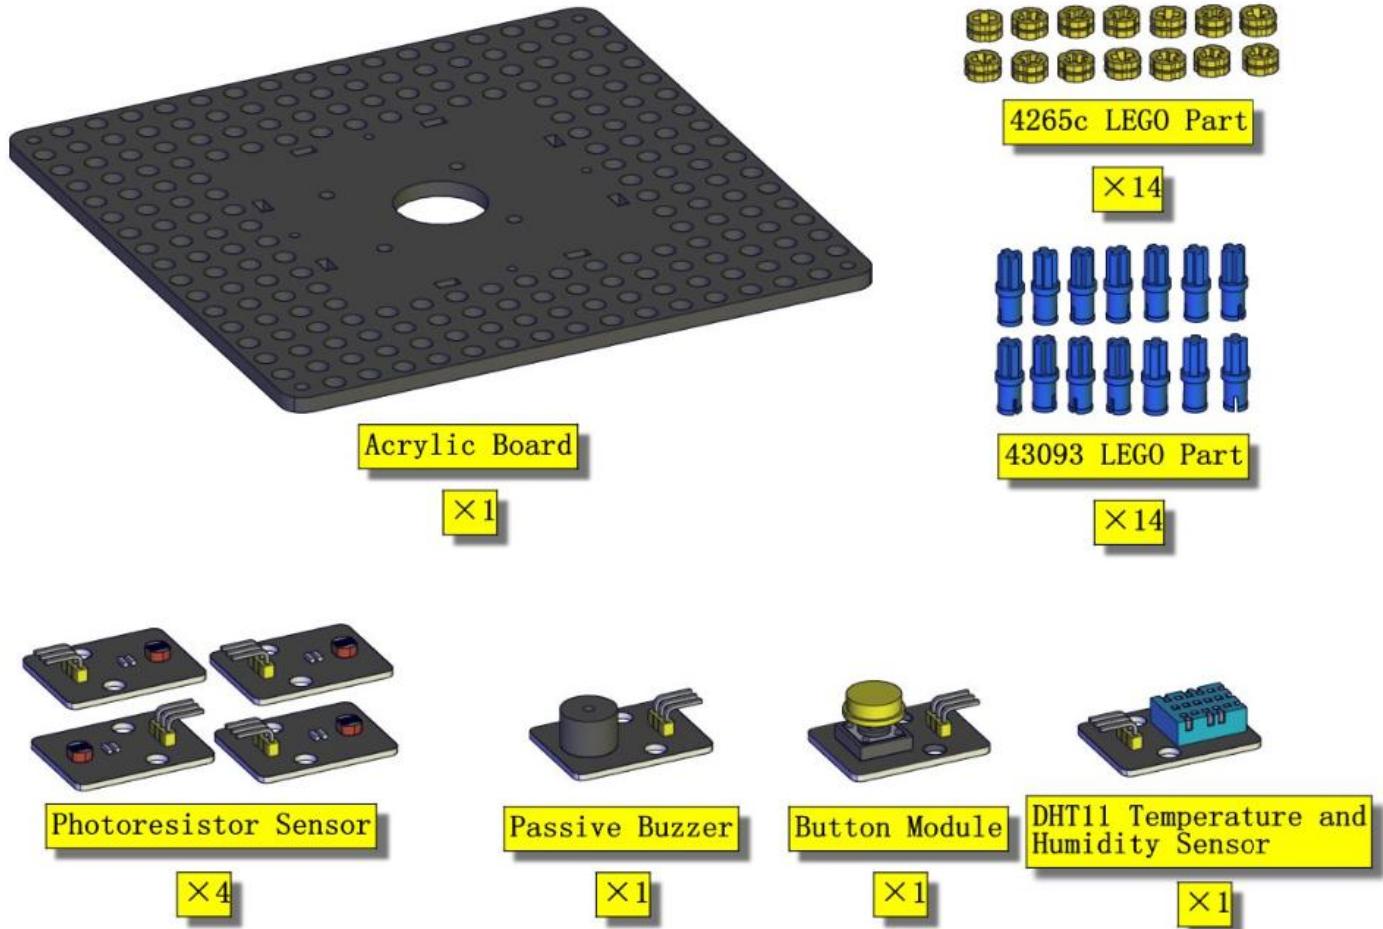

3) Install an 18650 battery inside the battery case, taking care that the positive and negative terminals of the battery are all the way to the positive and negative terminals of the battery case.

Connect the battery case to the solar usb charging module and mobile phone charging module.

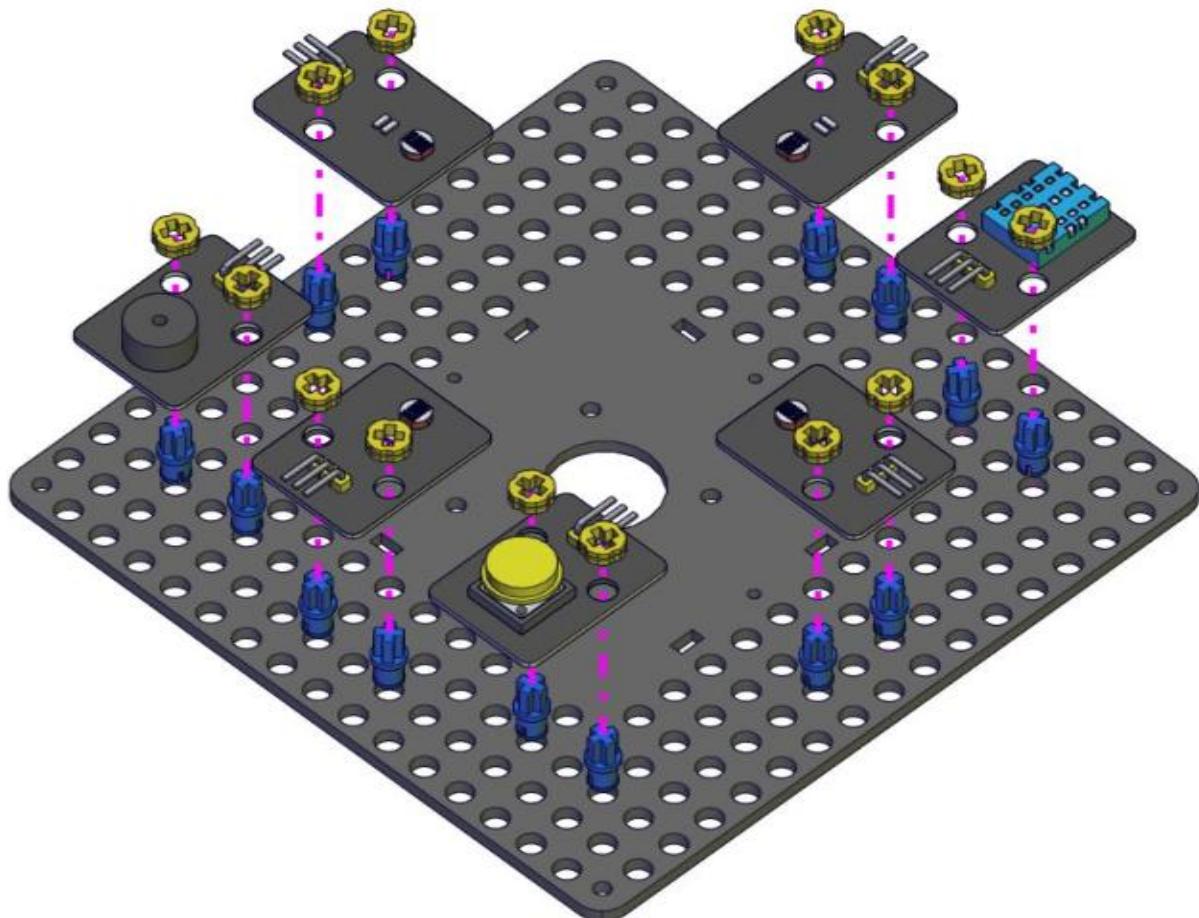

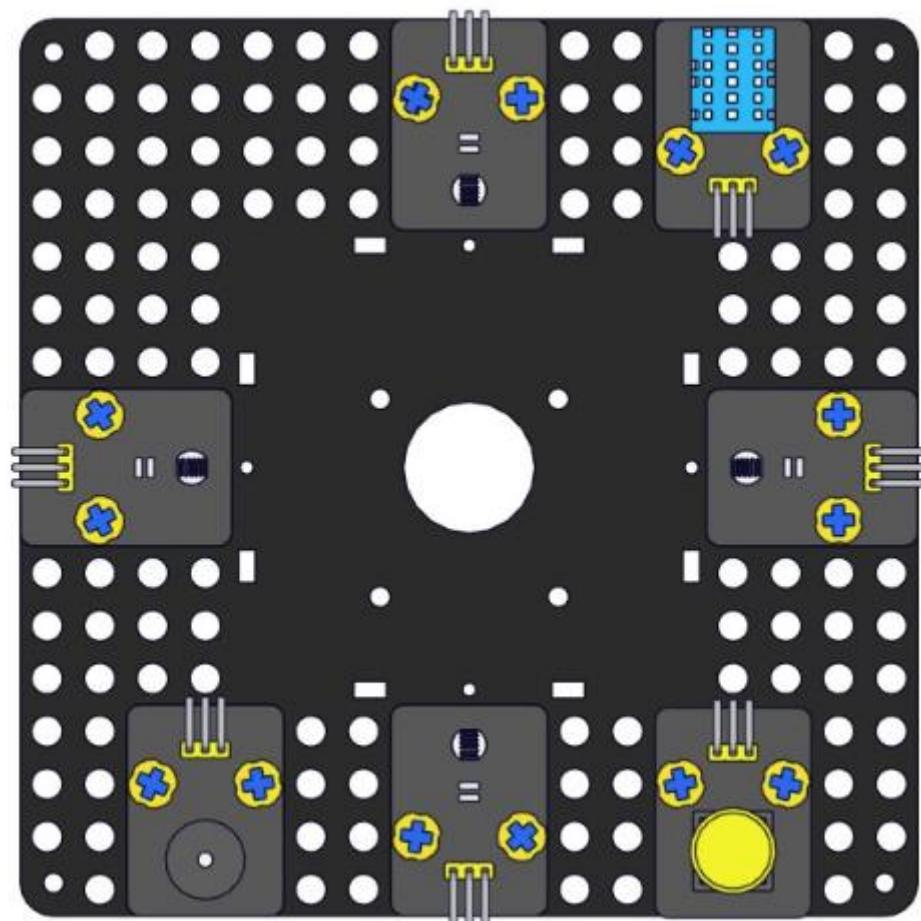

Part 5

Components Needed

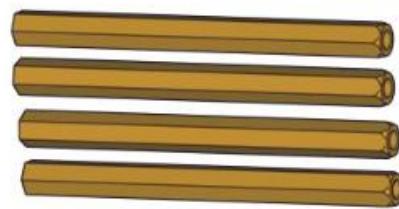

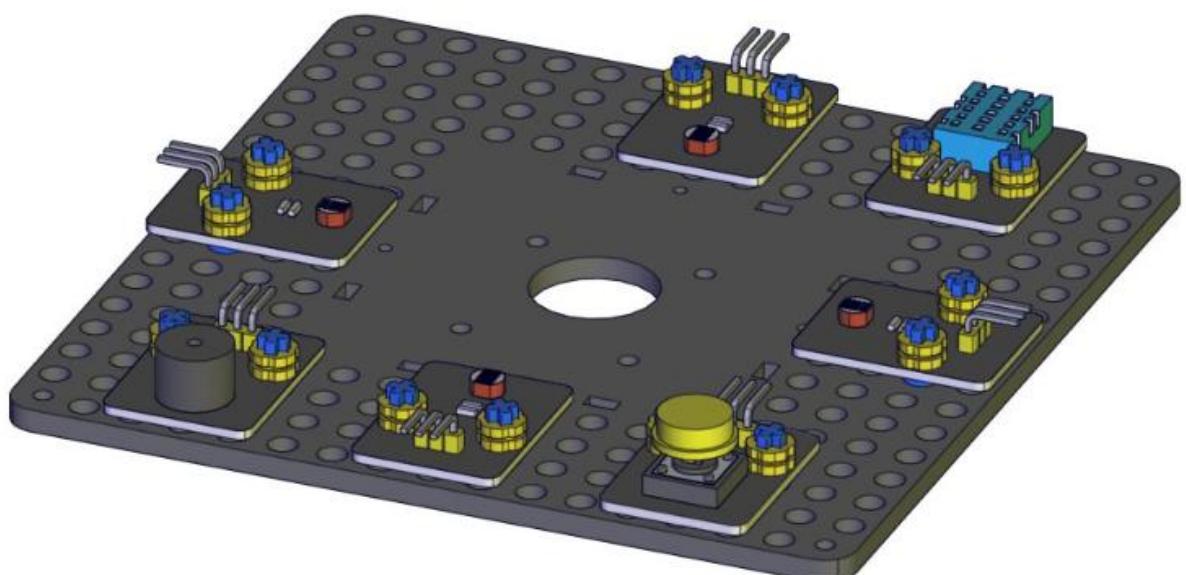

Assembling the sensors and modules

Installation Diagram (mind the installation direction of the servo)

Part 10

Components Needed

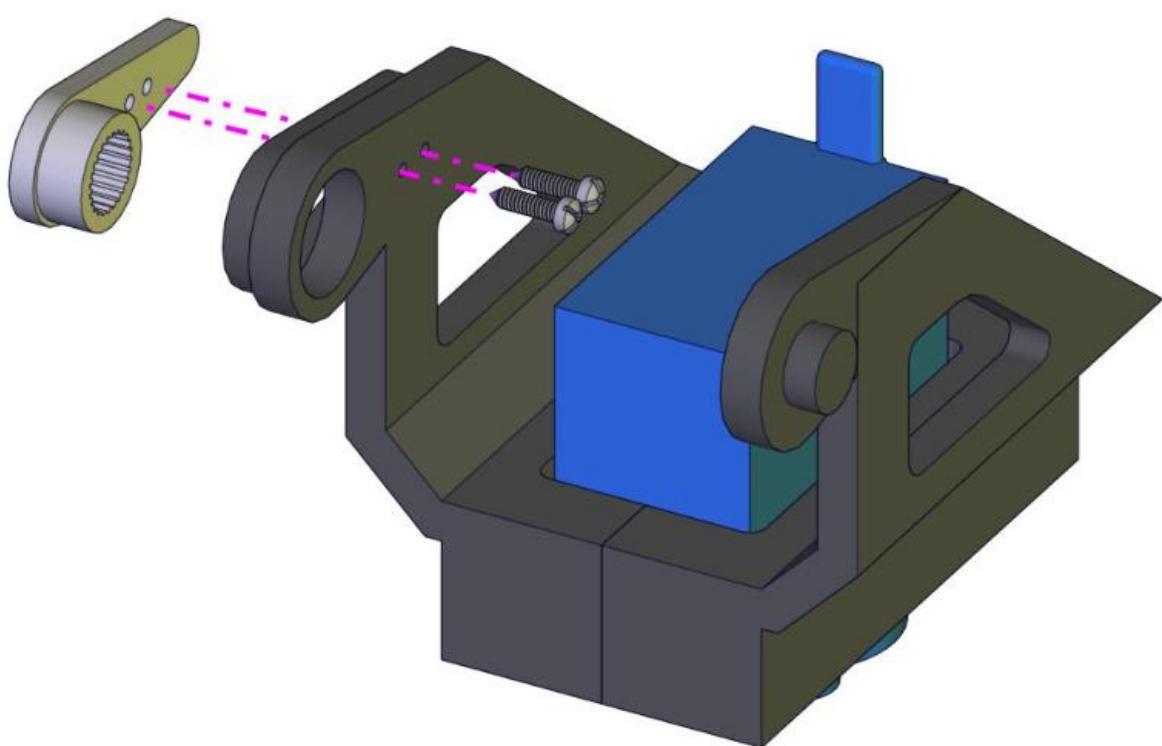

Coupling (belong to Servo)

×1

M1.2*4MM Round-head screws
(belong to Servo Mount)

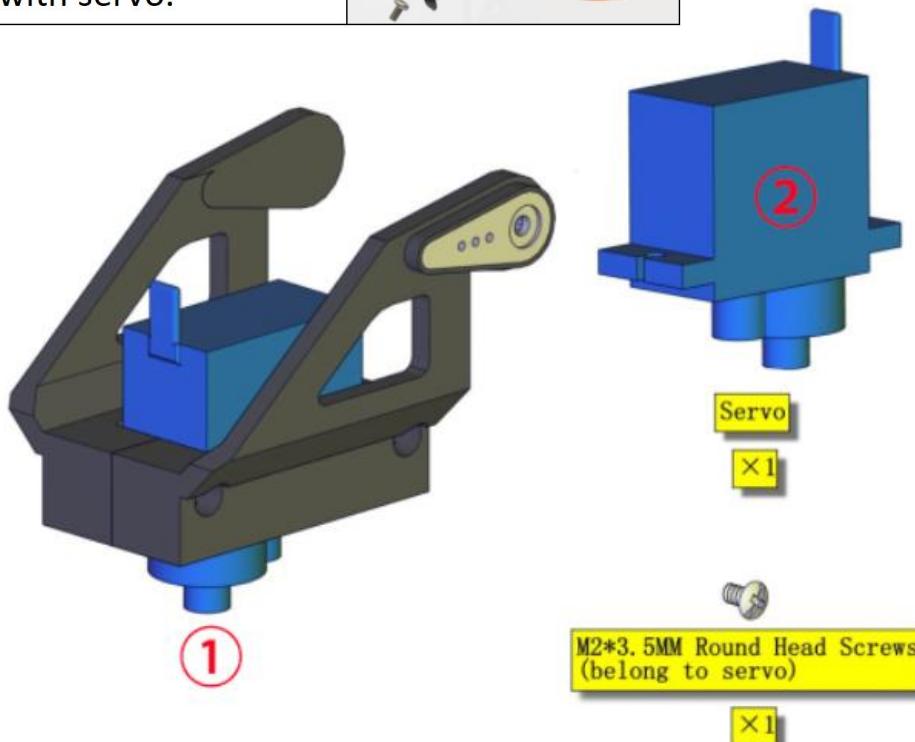

×2

Part 11

Components Needed

The screws listed below are packaged with servo.

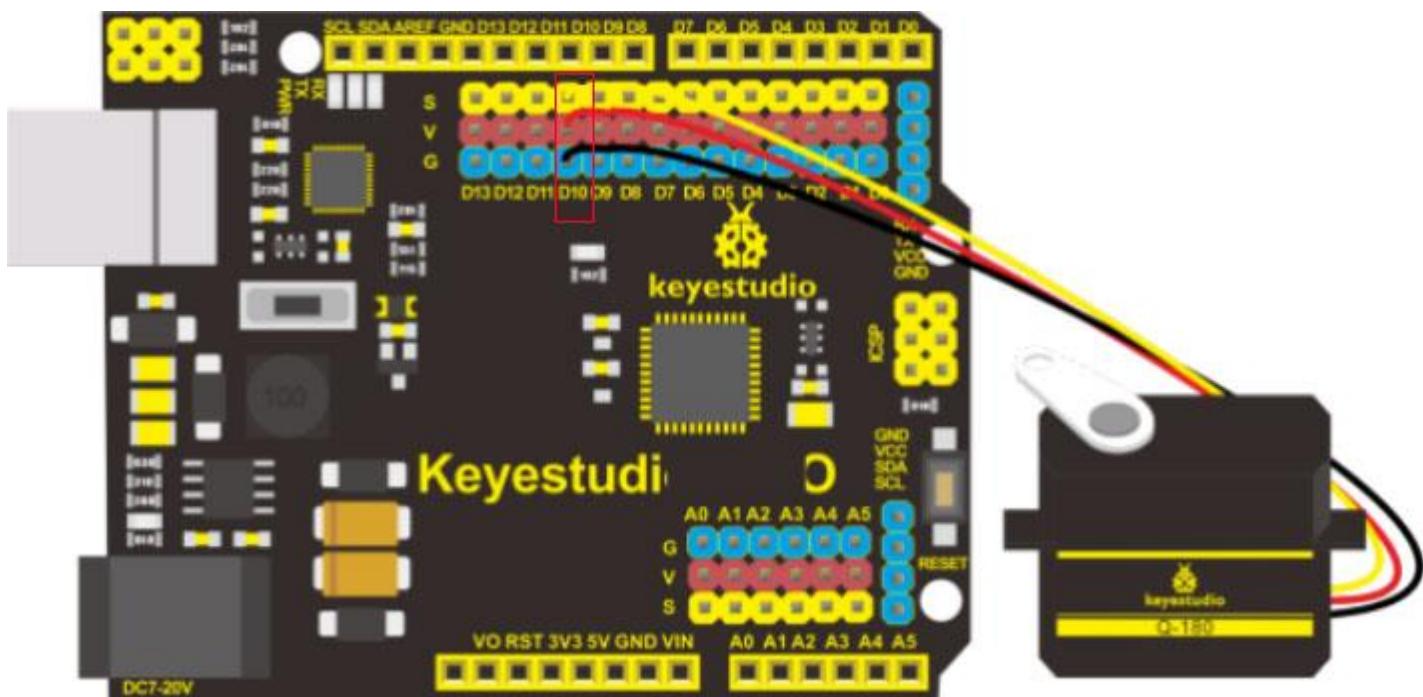

Before putting them together, you need to adjust the angle of the servo (2). Set its initial angle to 10 degrees to keep the solar panel level.

Before putting them together, you need to adjust the angle of the **servo** (2). Set its initial angle to **10 degrees** to keep the solar panel level.

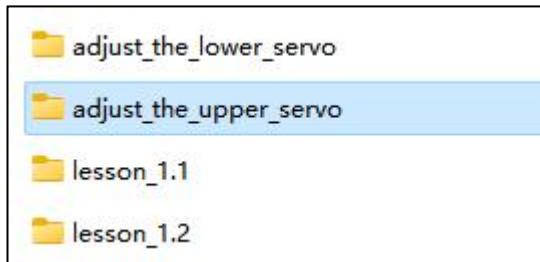

Connection Diagram

Note: The servo is connected to G (GND), V (VCC), D10. The brown wire is connected to Gnd (G), the red wire is connected to (V), and the orange wire is connected to digital pin D10.

1. Connect the control board to the computer with the usb cable.

2. Open the INO file inside the **adjust_the_upper_servo** folder with Arduino IDE.

3. Click the board selector or tool menu to select "Arduino Uno" and COM-XX

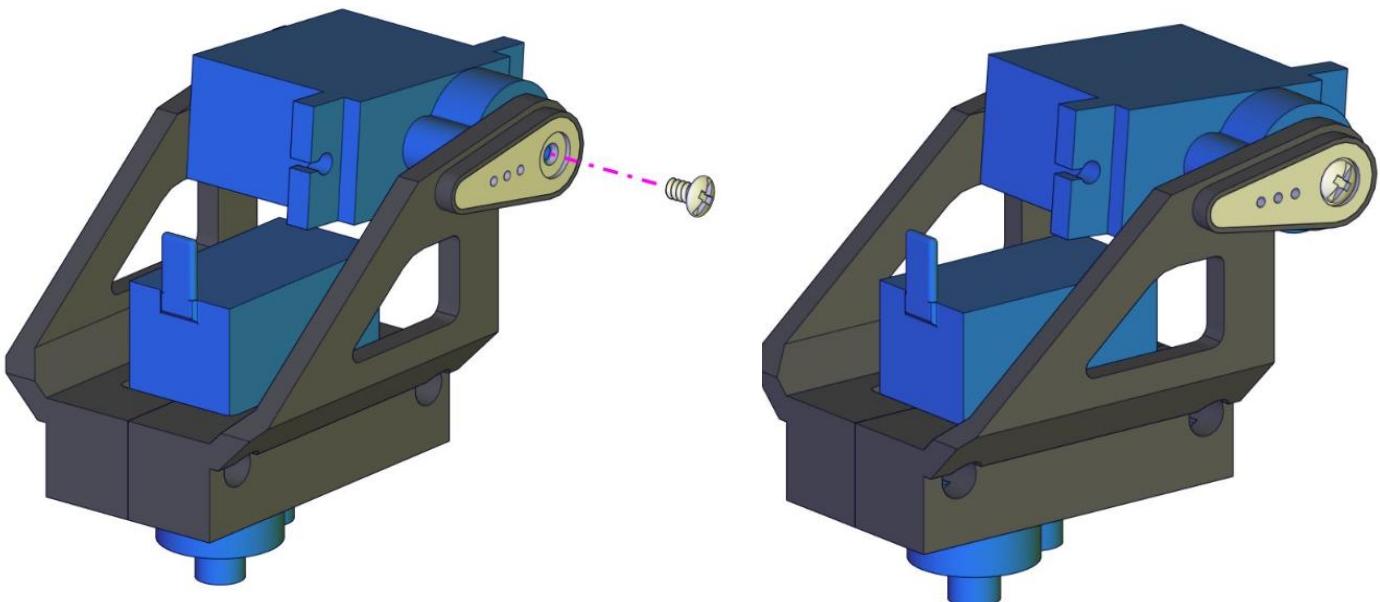

4. Click upload >>>done uploading.

The angle of the servo will be set to 10°

```
#include <Servo.h>
Servo ud_servo;//define the name of the servo rotating right and left
int ud_angle = 10;//set the initial angle to 10 degree;keep the solar panels upright to detect the strongest light
const byte ud_servopin = 10;//define the servo rotating upwards and downwards and its control pin

void setup() {
ud_servo.attach(ud_servopin); // set the control pin of the servo
ud_servo.write(ud_angle);
delay(1000);
}
void loop() {}
```

Installation Diagram (pay attention to the angle of the servo, as shown in the picture)

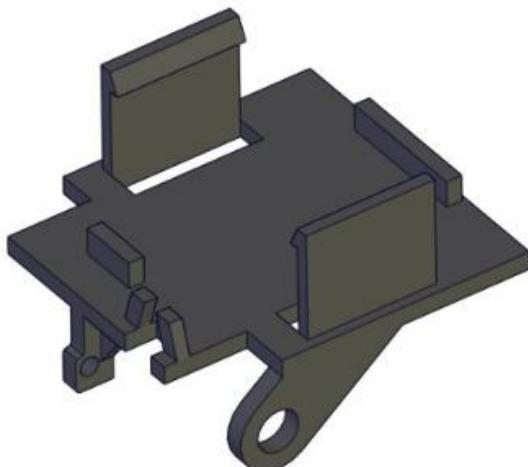

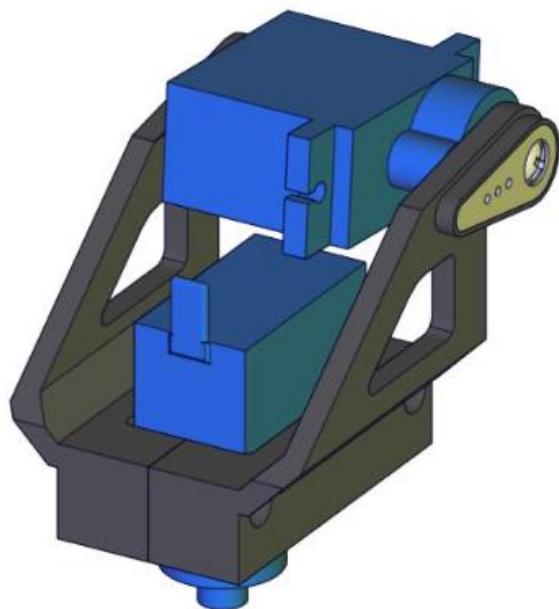

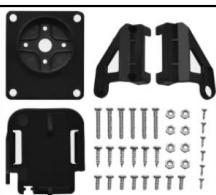

Note: You cannot turn the servo shaft until you have completed this fixing step, otherwise you will need to re-set it to 10 degree using the code above.

Part 12

Components Needed

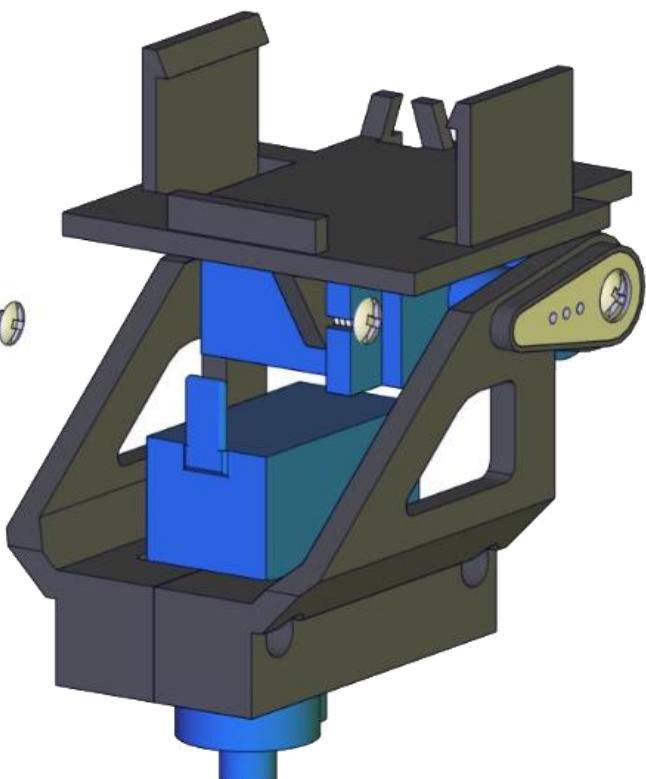

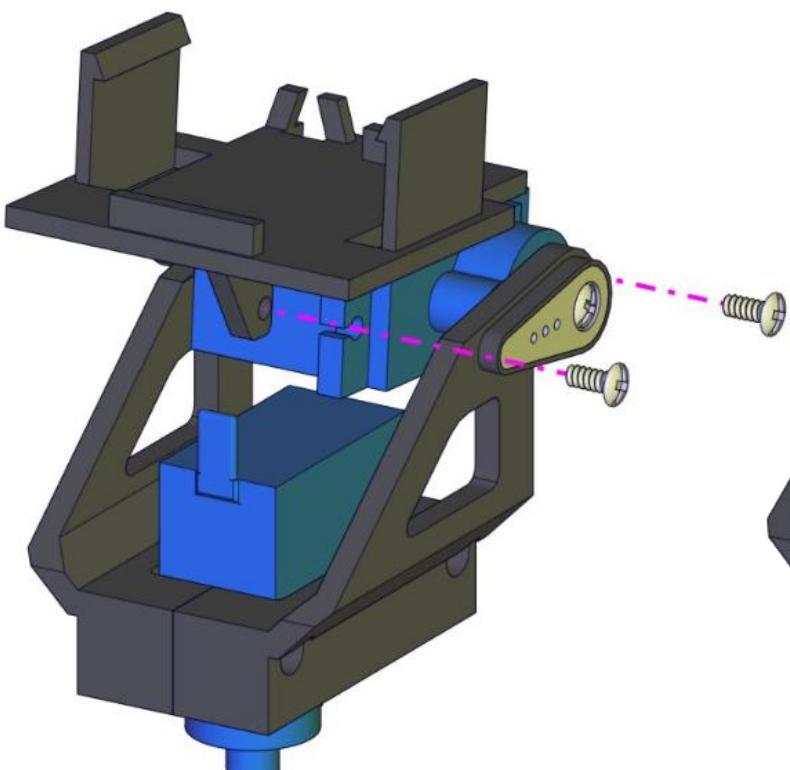

The screws listed below are packaged with servo mount.

Servo Mount

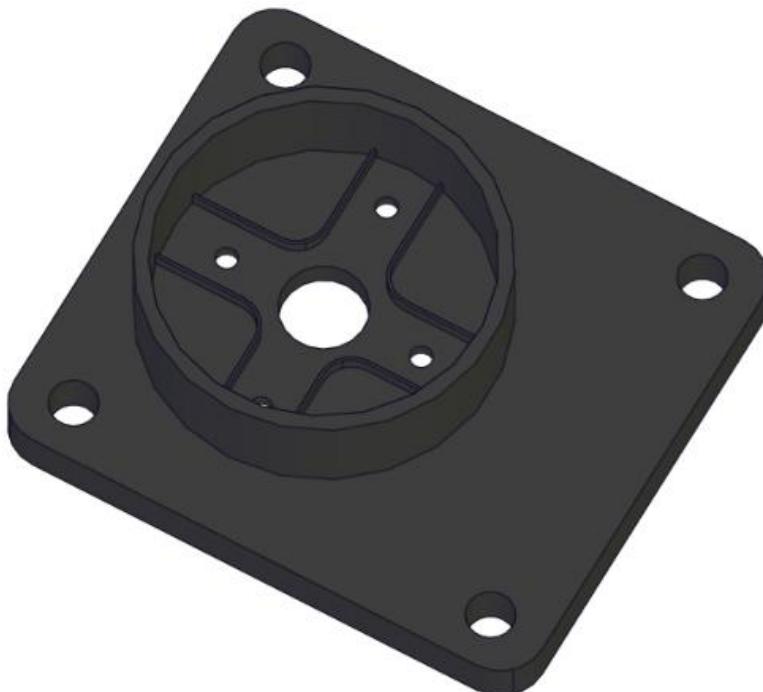

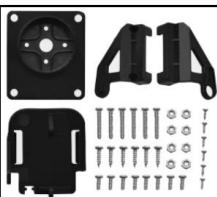

M2*4.5MM Round Head Screws
(belong to Servo Mount)

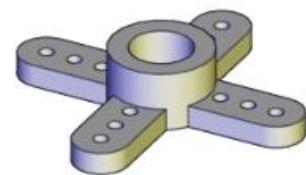

Part 13

Components Needed

The screws listed below are packaged with servo mount.

Servo Mount

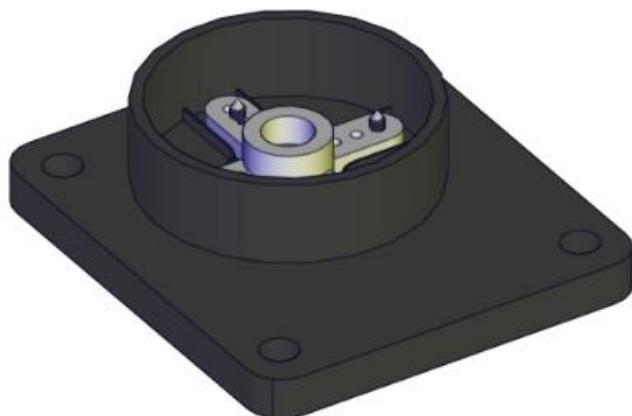

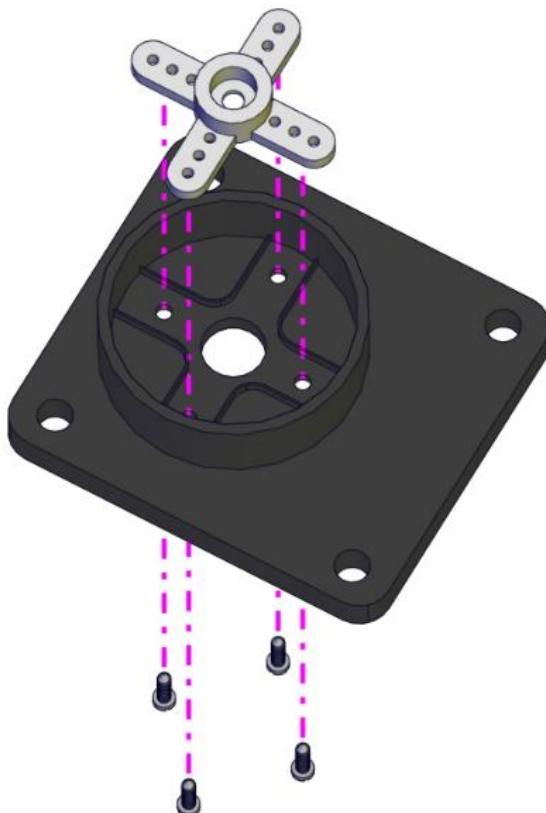

Coupling

M1.2*4MM Round-head screws
(belong to Servo Mount)

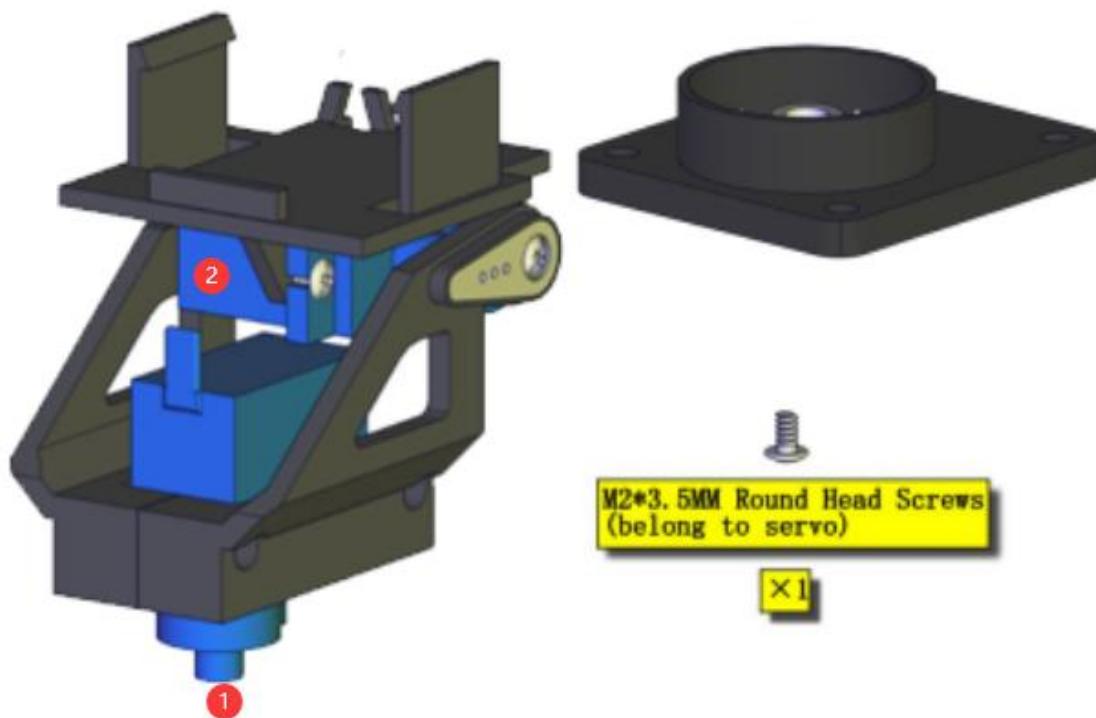

×4

Part 14

Components Needed

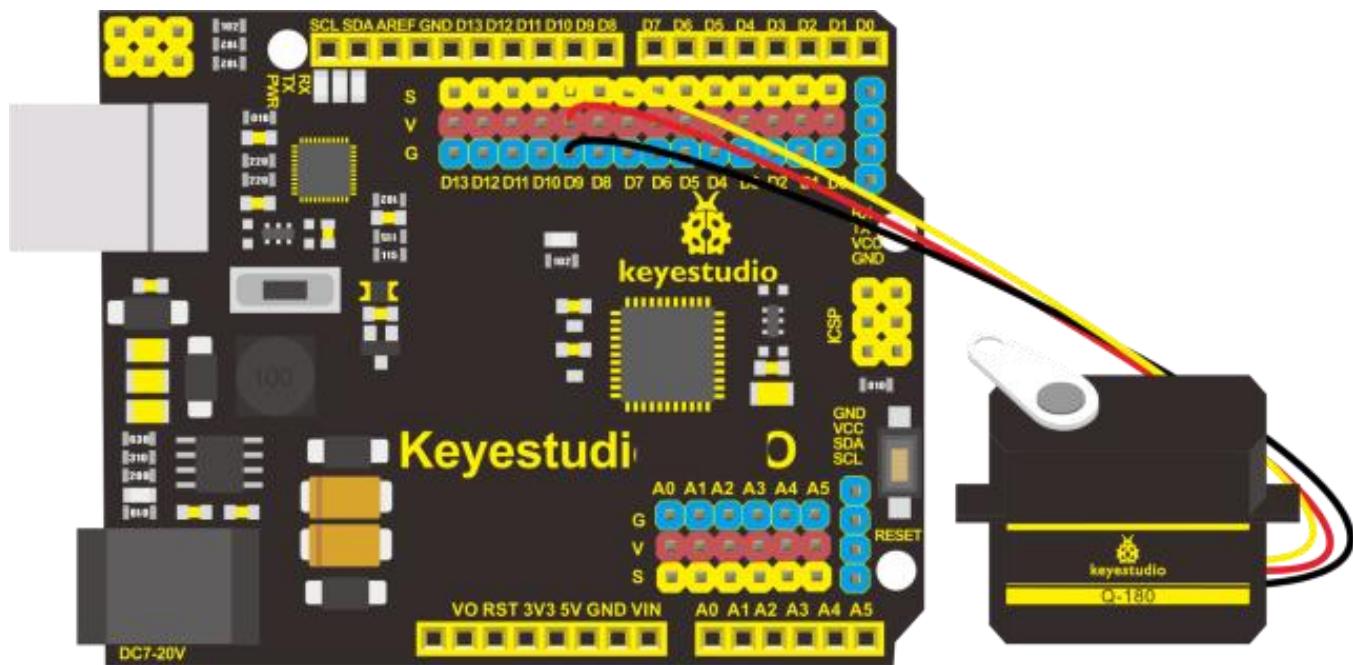

The screws listed below are packaged with servo.

Before putting them together, you need to adjust the angle of the **servo** ①. Set its initial angle to **90 degrees**.

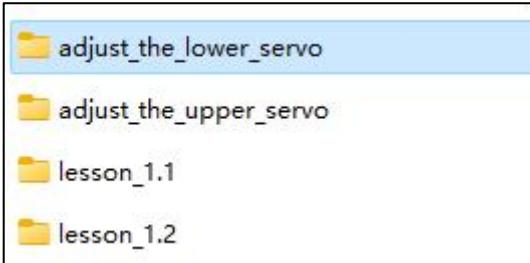

Connection Diagram

Note: The servo is connected to G (GND), V (VCC), D9. The brown wire is connected to Gnd (G), the red wire is connected to (V), and the orange wire is connected to digital pin D9.

1. Connect the control board to the computer with the USB cable.

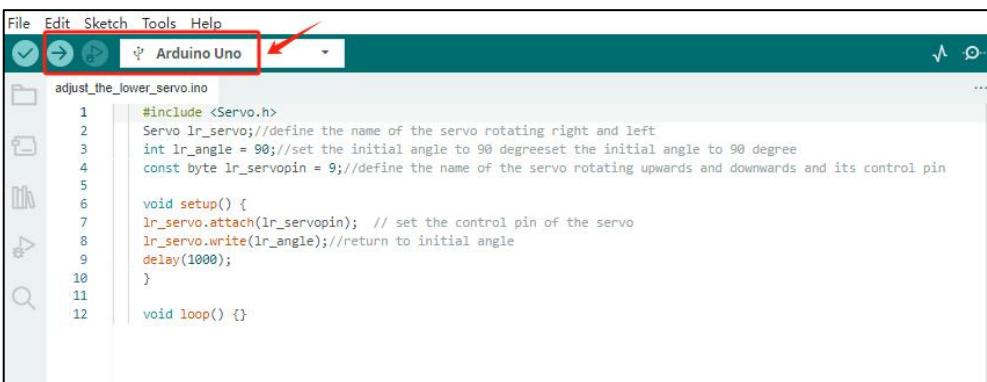

2. Open the INO file inside the **adjust_the_lower_servo** folder with Arduino IDE.

3. Click the board selector or tool menu to select "Arduino UNO" and COM-XX

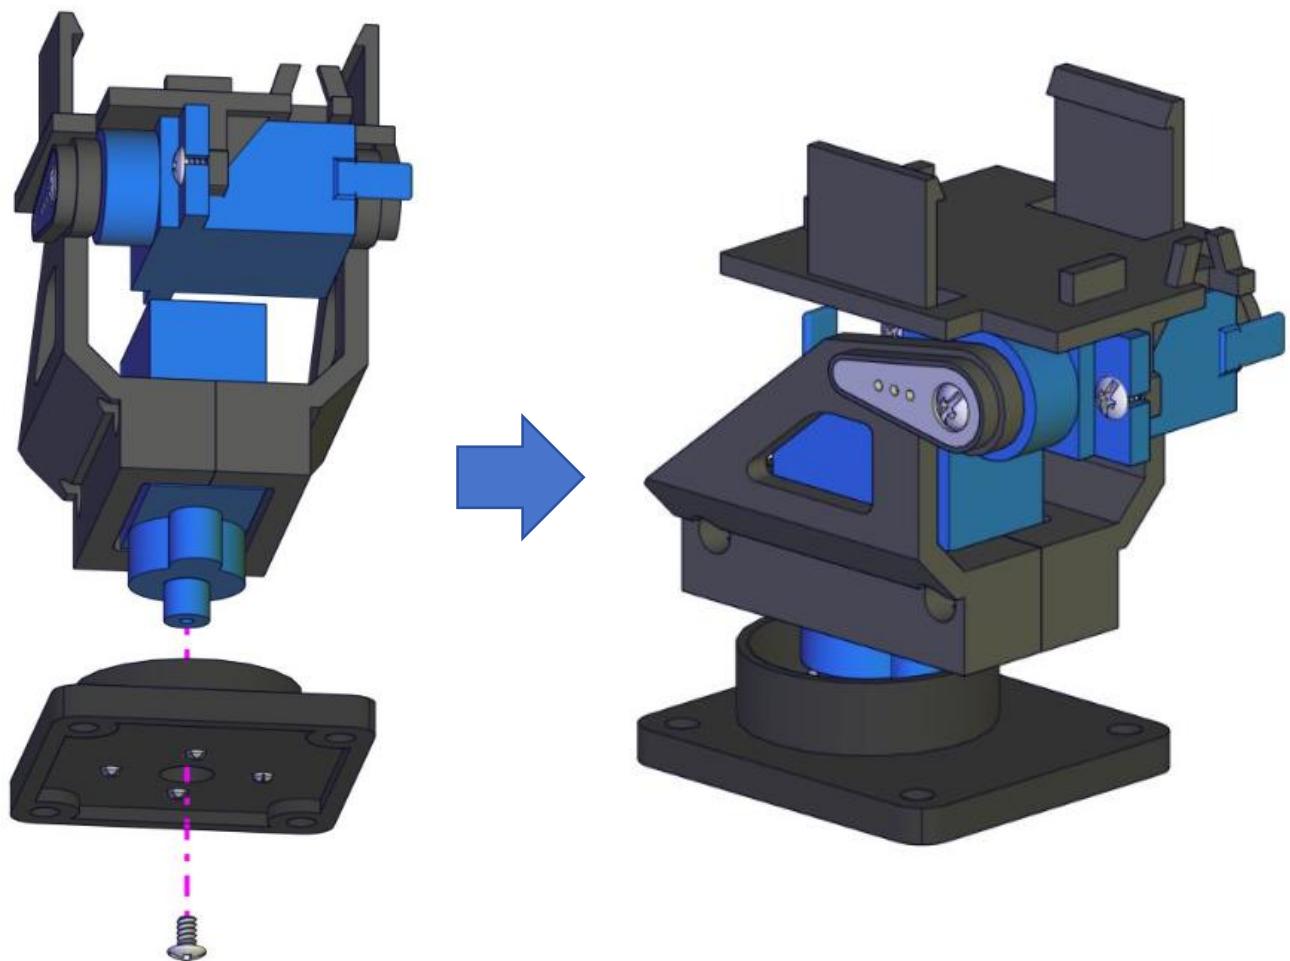

4. Click upload >>> done uploading.

The angle of the servo will be set to 90°

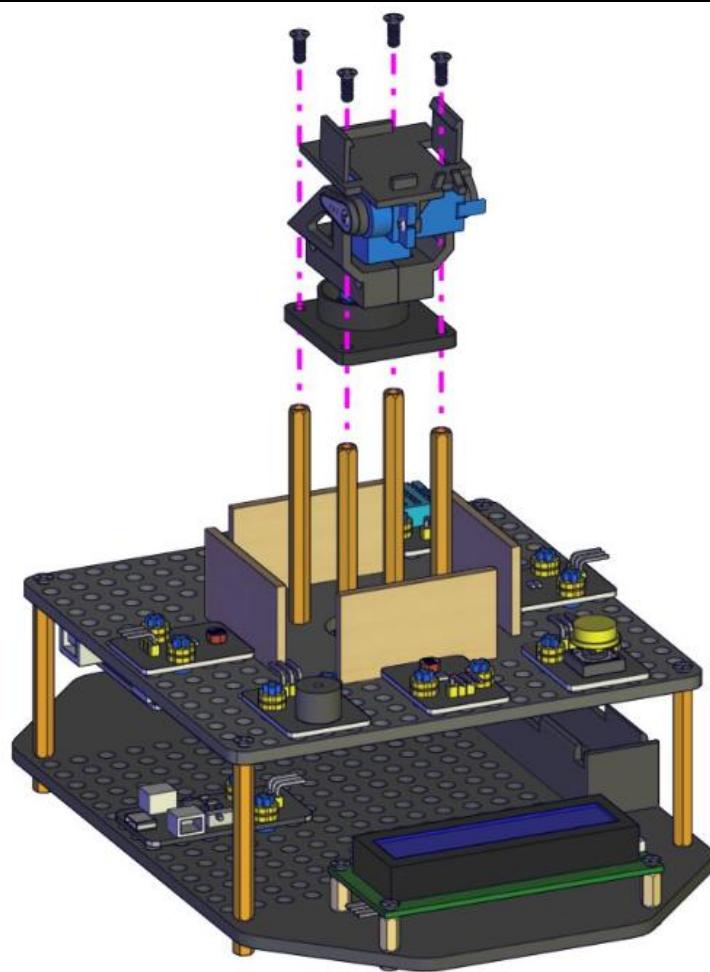

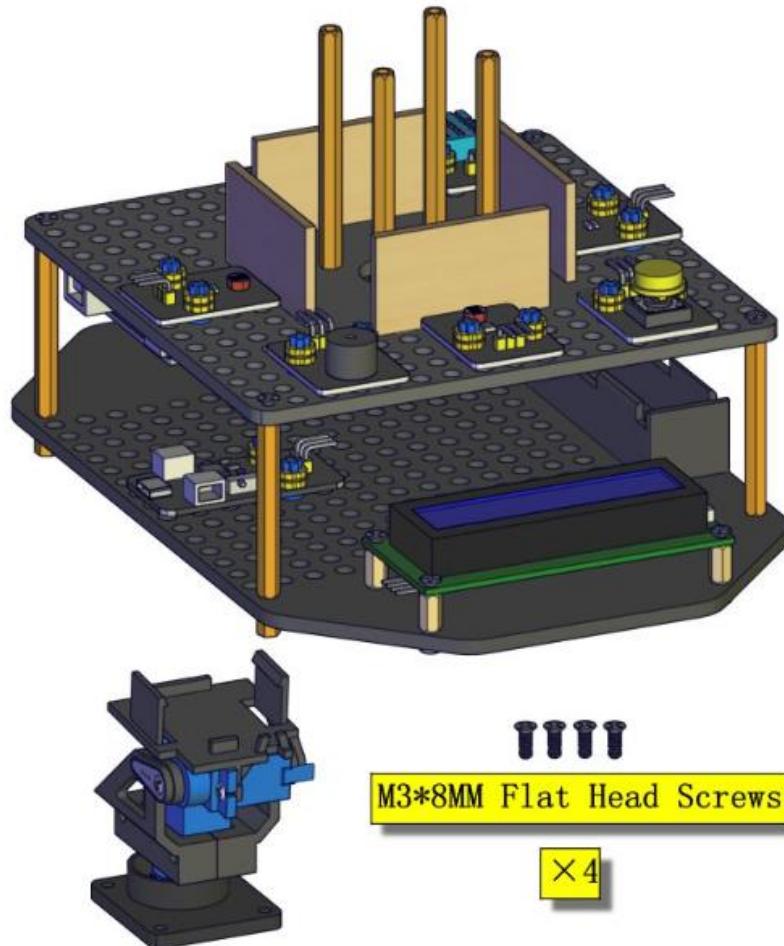

Installation Diagram

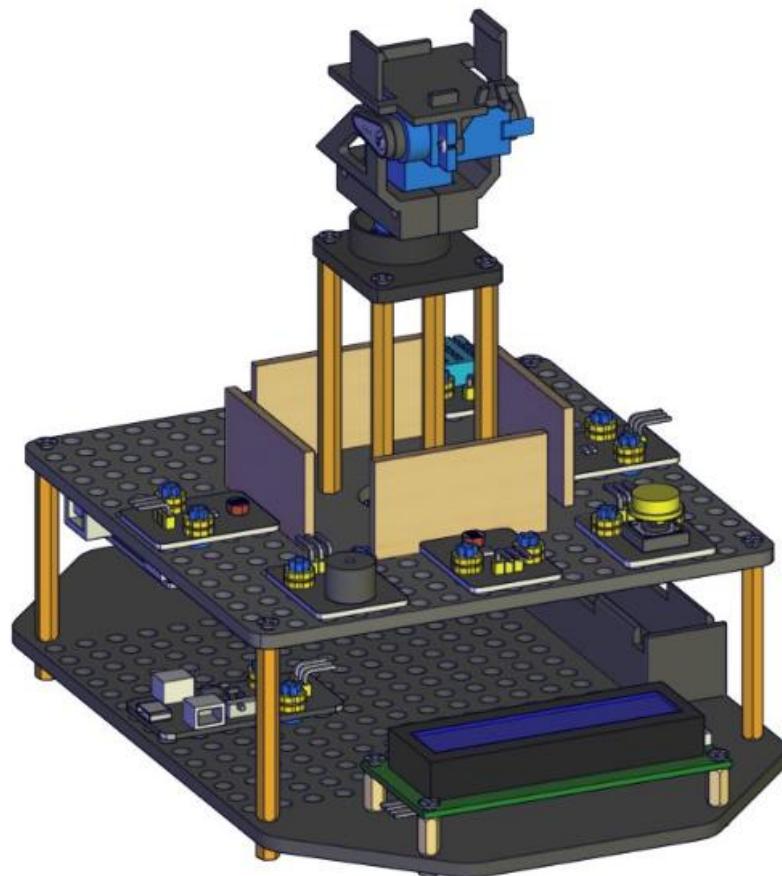

Note: You cannot turn the servo shaft until you have completed this fixing step, otherwise you will need to re-set it to 90 degree using the code above.

Part 15

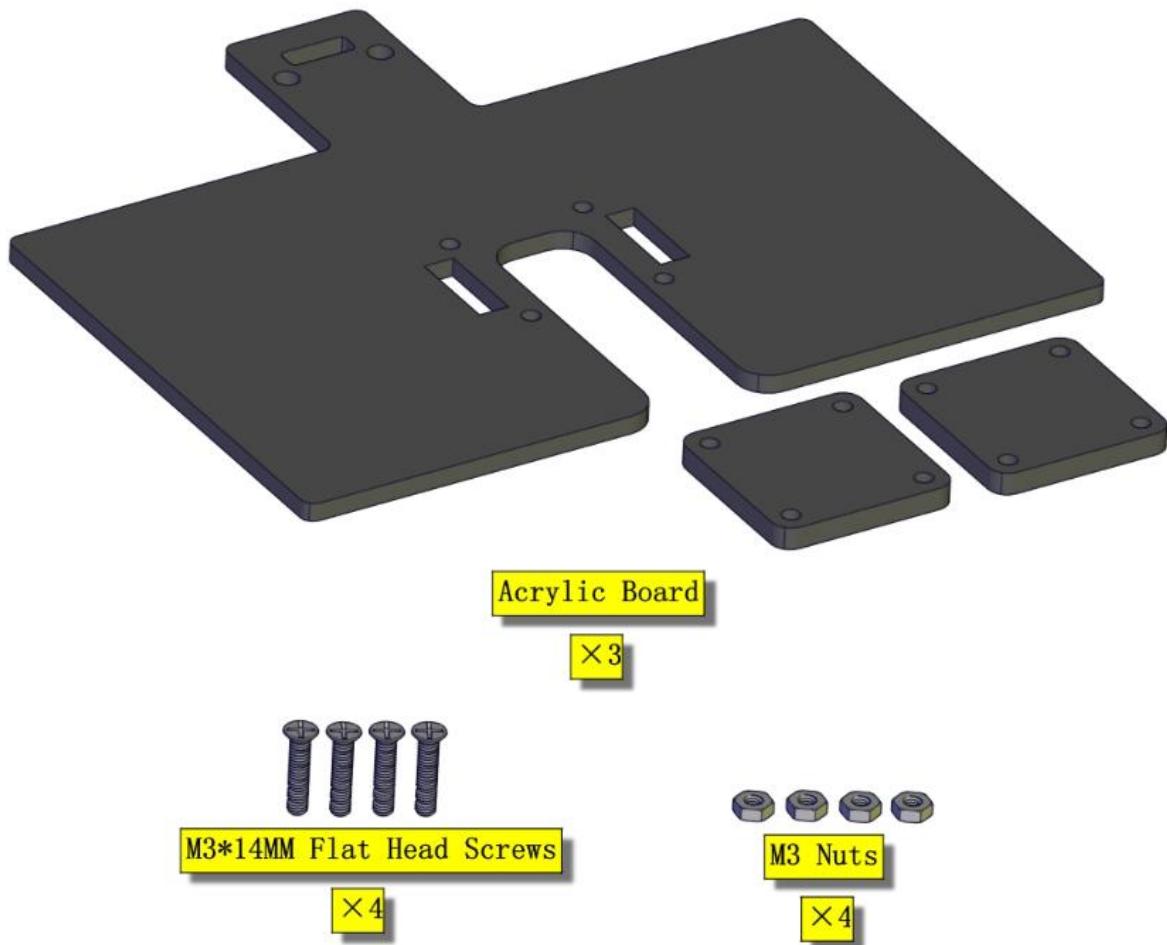

Components Needed

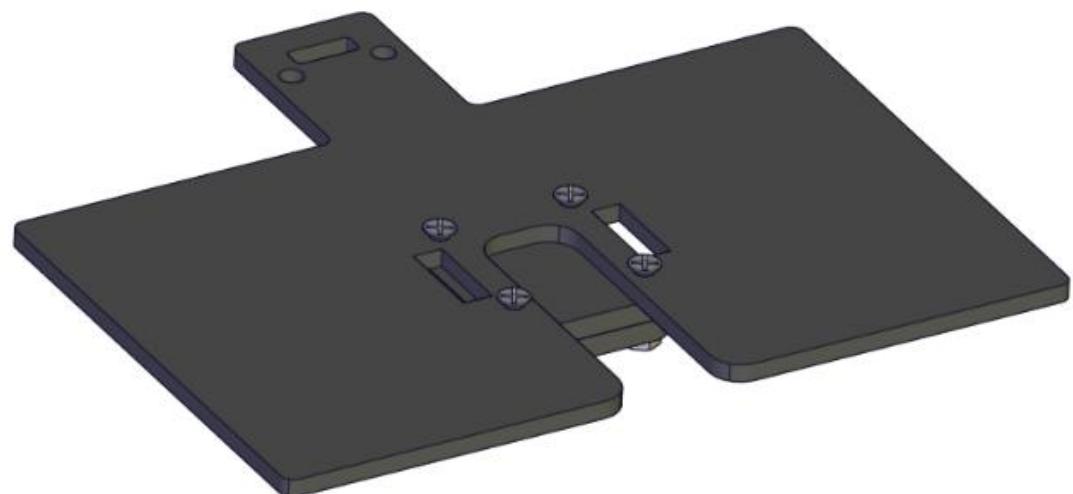

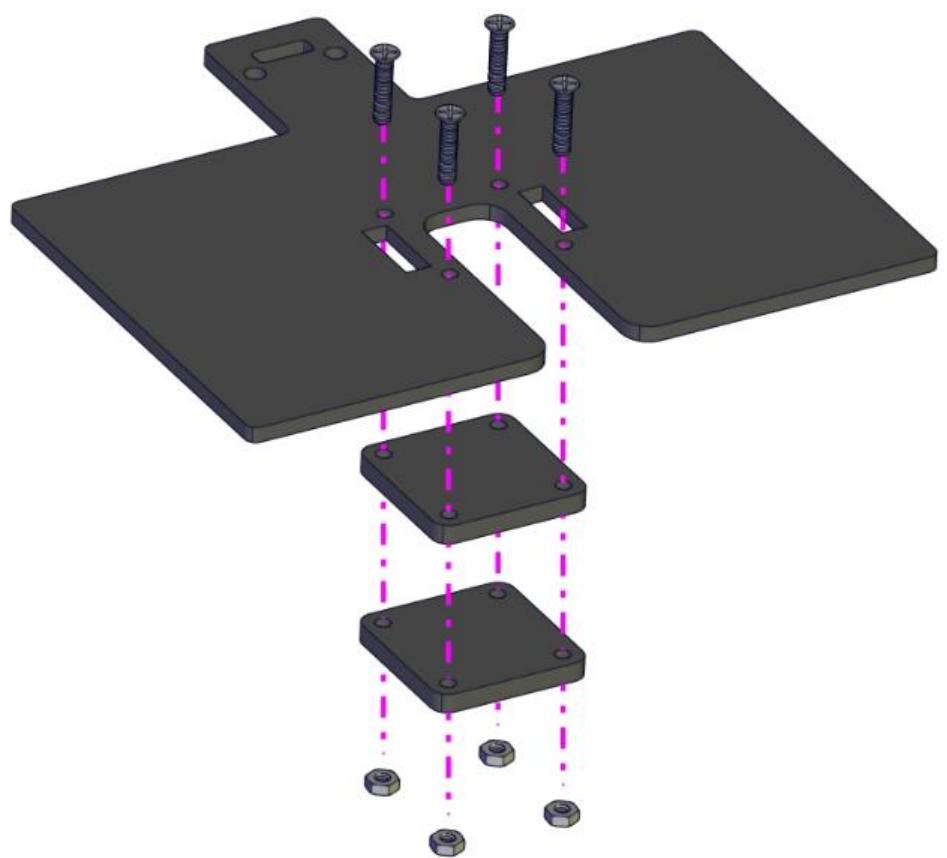

Part 16

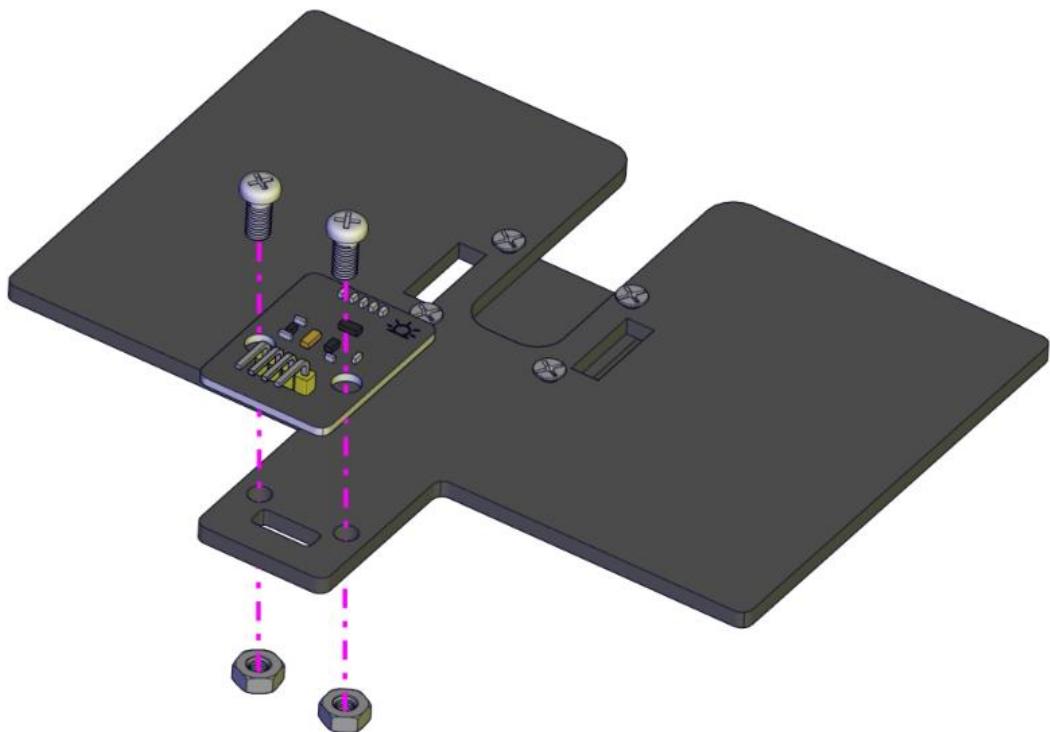

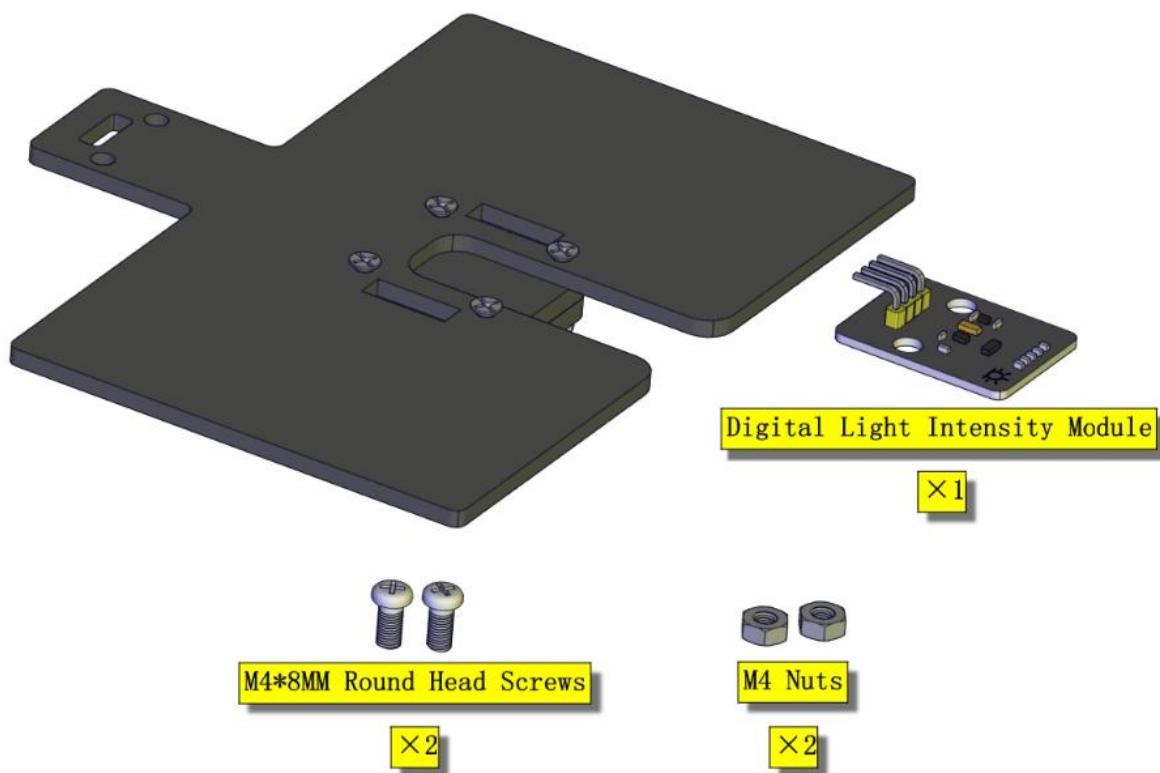

Components Needed

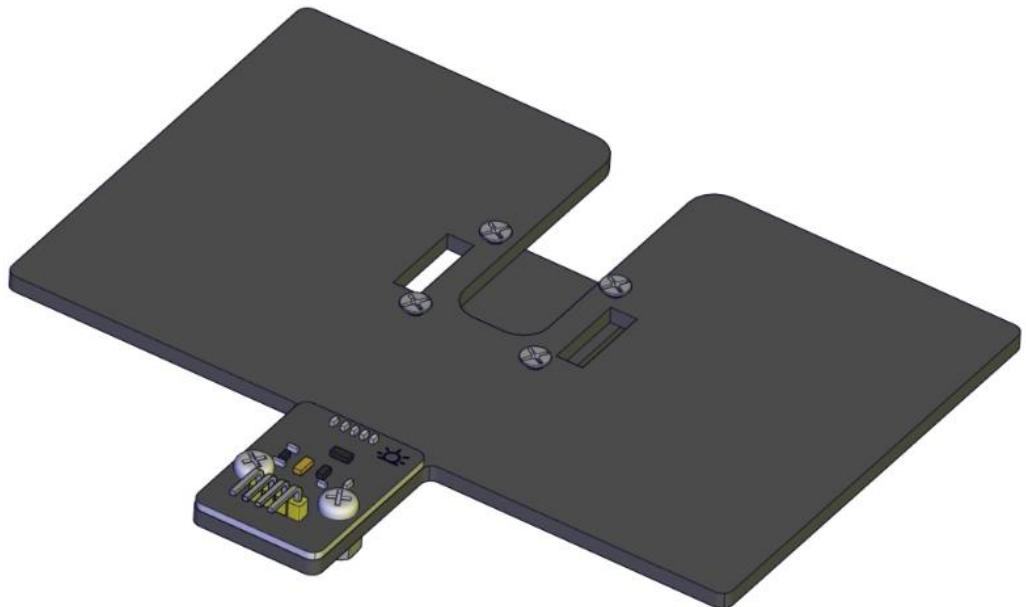

Part 17

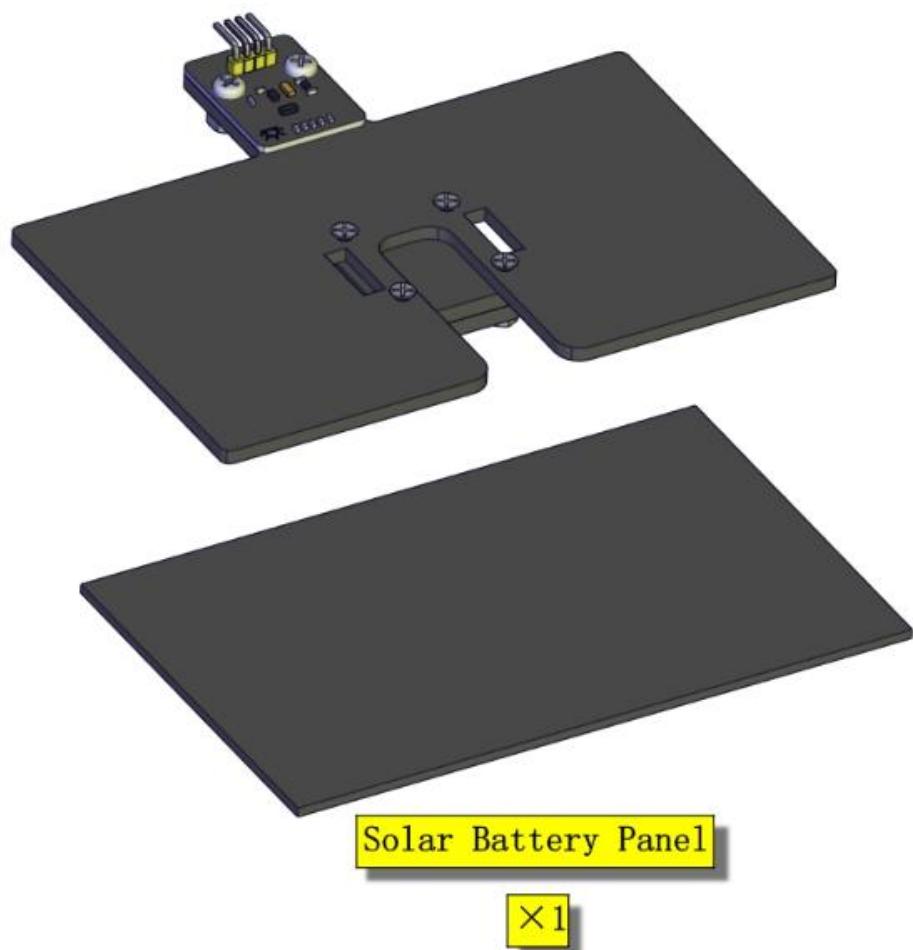

Components Needed

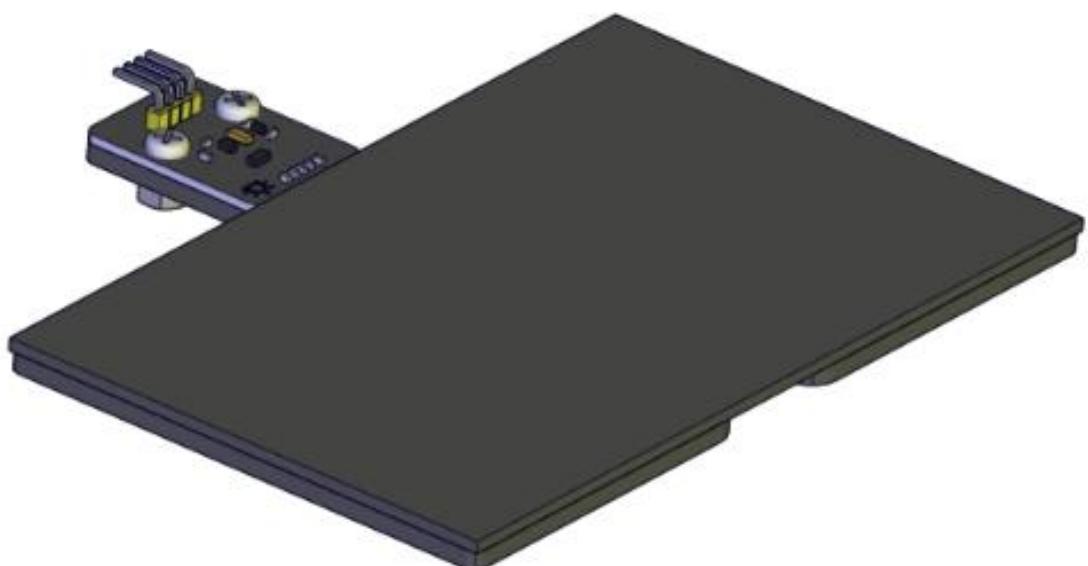

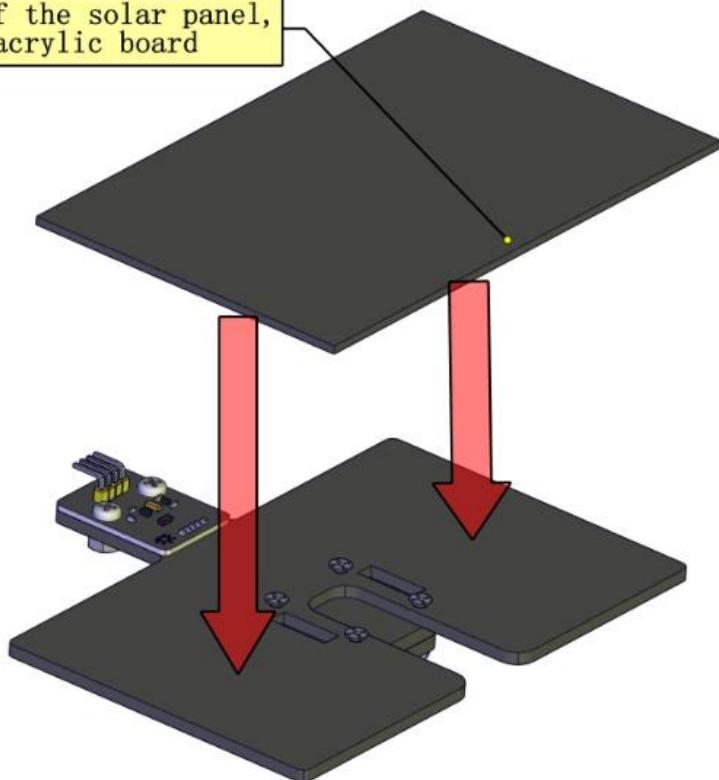

Part 18

Components Needed

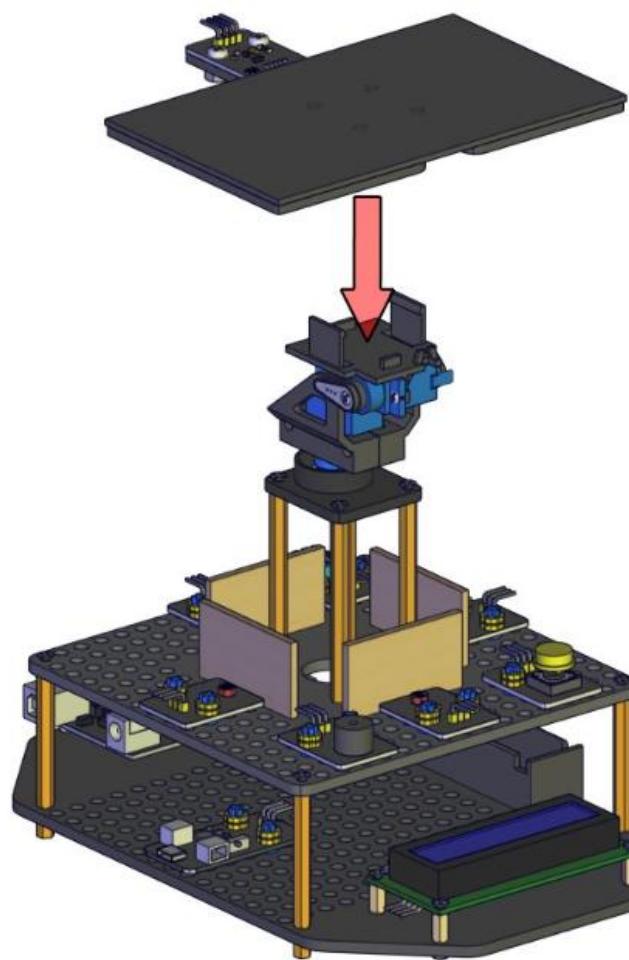

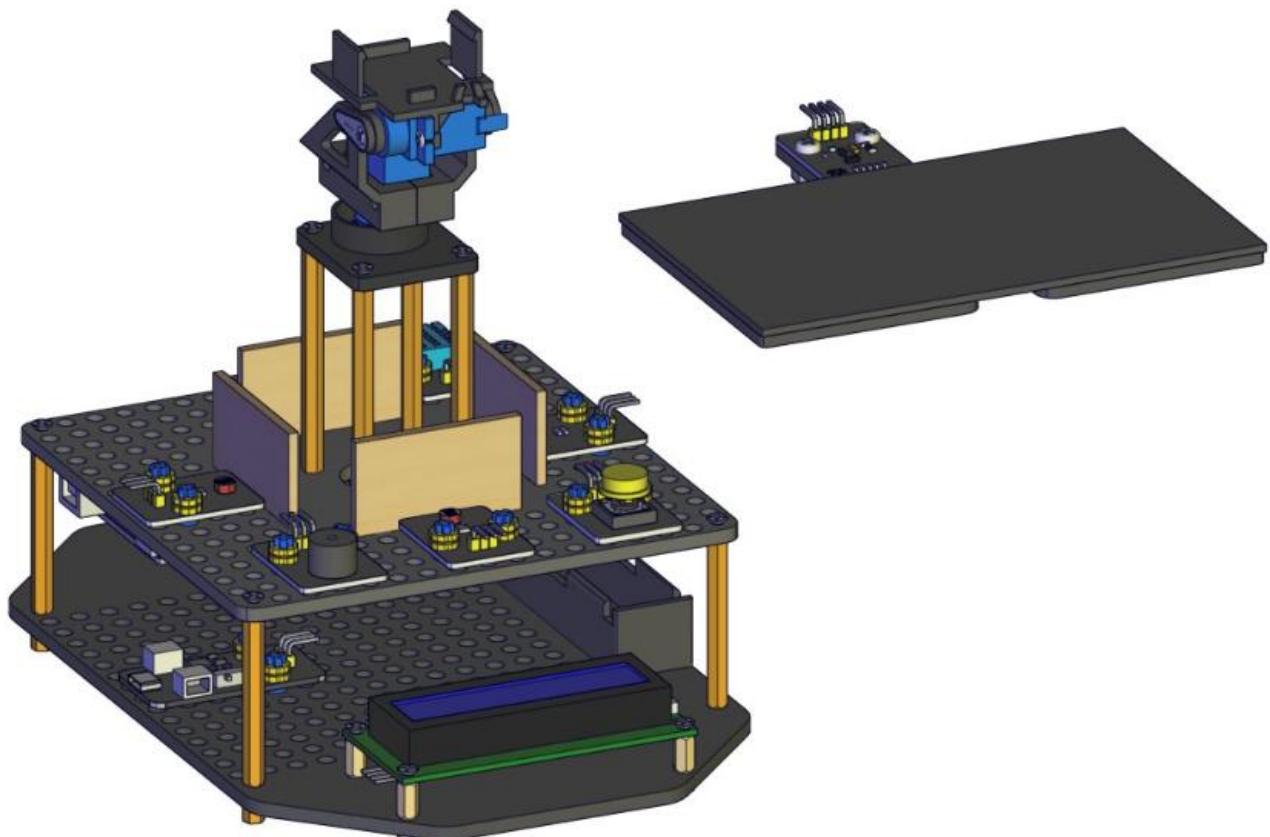

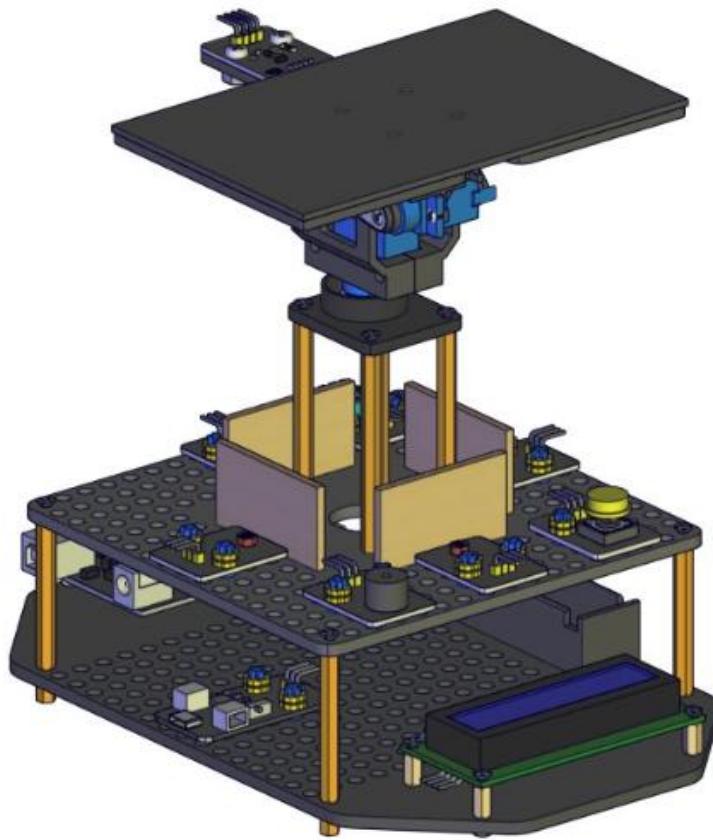

Tear the thin film off the solar panel,
then stick it on the acrylic board

Part 19

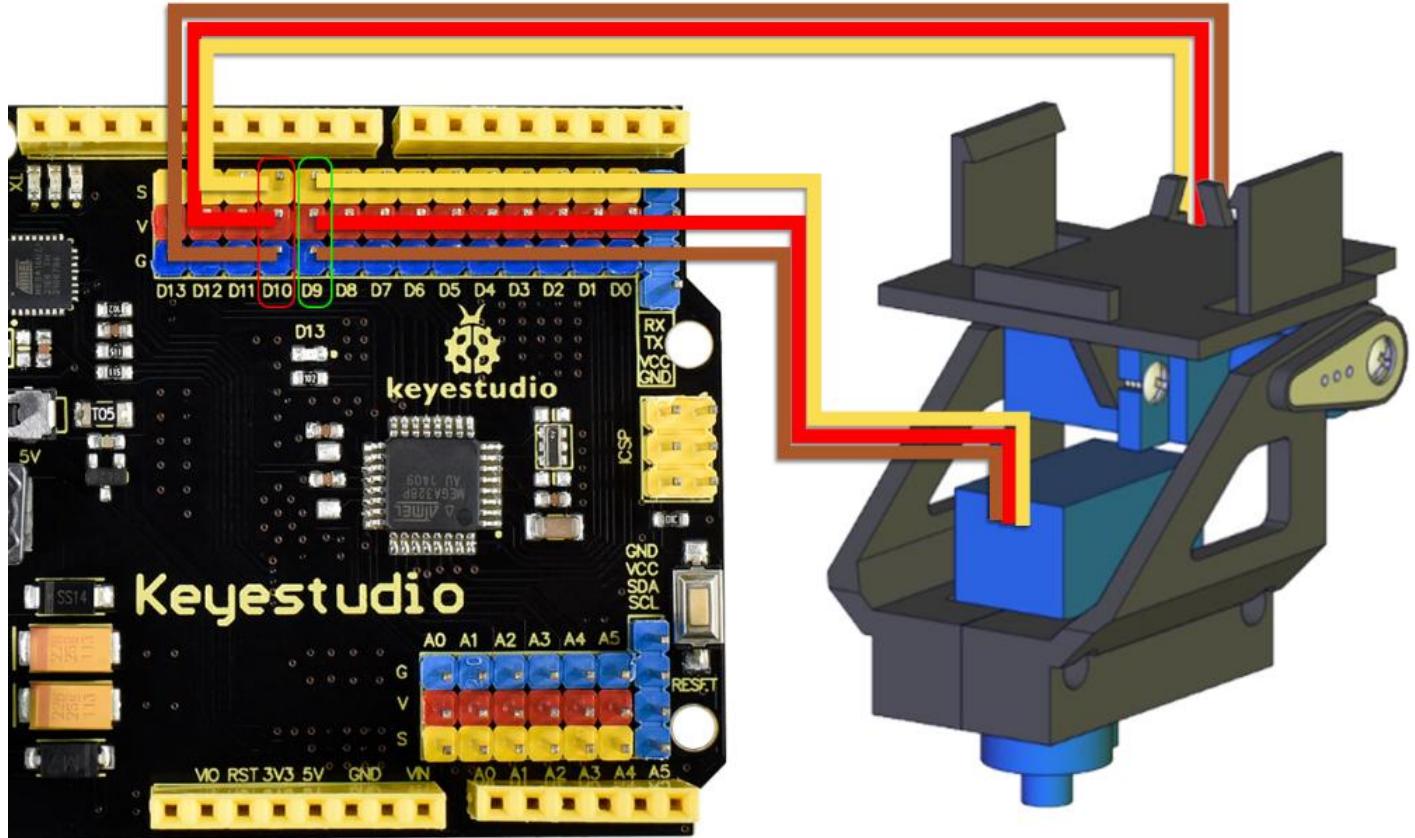

Components Needed

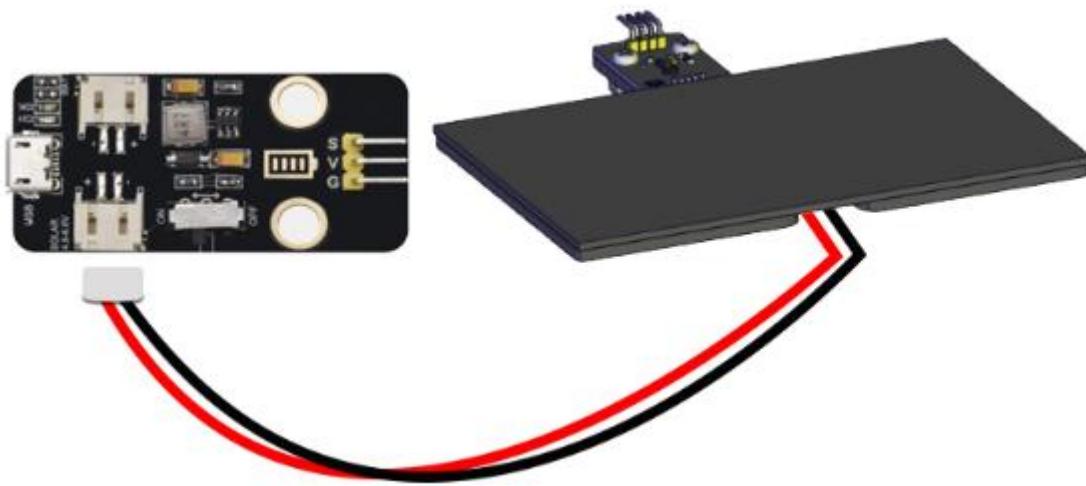

Wiring the Upper Part Of The Kit

- 1) Connect the lower servo to **D9** of the UNO control board, and the upper servo of **D10** on the UNO control board. Connect the brown wire of the servo to G, the red wire to V, and the yellow wire to S.

2) Plug the jack of the solar panel to the SOLAR4.8-6.0V end of the solar USB charging module.

2) Next, we will use the seven 3P 26AWG 200mm F-F DuPont Wires to connect the photosensors, buzzer module, pushbutton module and the DHT11 temperature and humidity sensor to the uno board.

3P 26AWG 200mm F-F DuPont Wire

The photosensitive sensor on the left is connected to the A0 pin of UNO board.

The photosensitive sensor on the right is connected to the A1 pin of UNO board.

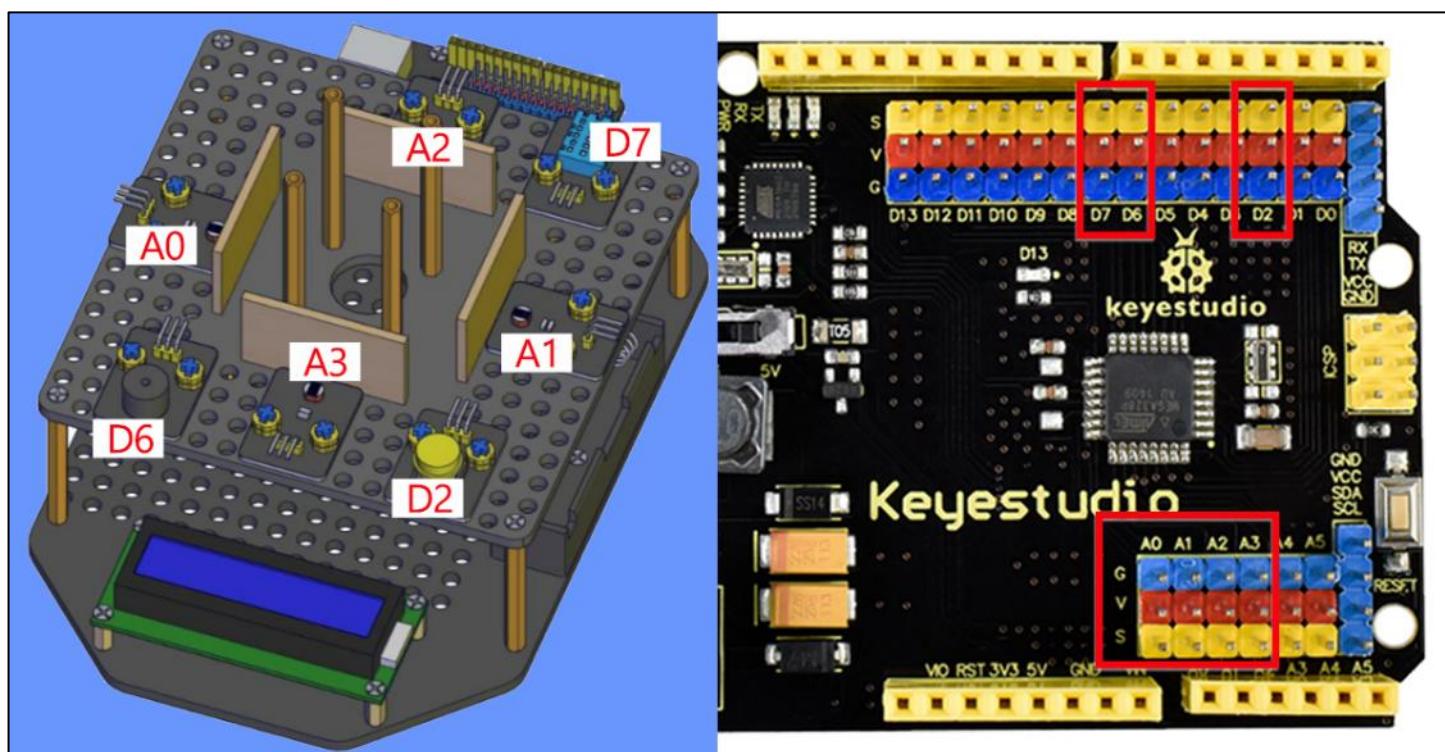

The photosensitive sensor on the back is connected to the A2 pin of UNO board.

The photosensitive sensor on the front is connected to the A3 pin of UNO board.

The button module is connected to the D2 pin of UNO board.

The buzzer module is connected to the D6 pin of UNO board.

The dht11 temperature and humidity sensor is connected to the D7 pin of UNO board.

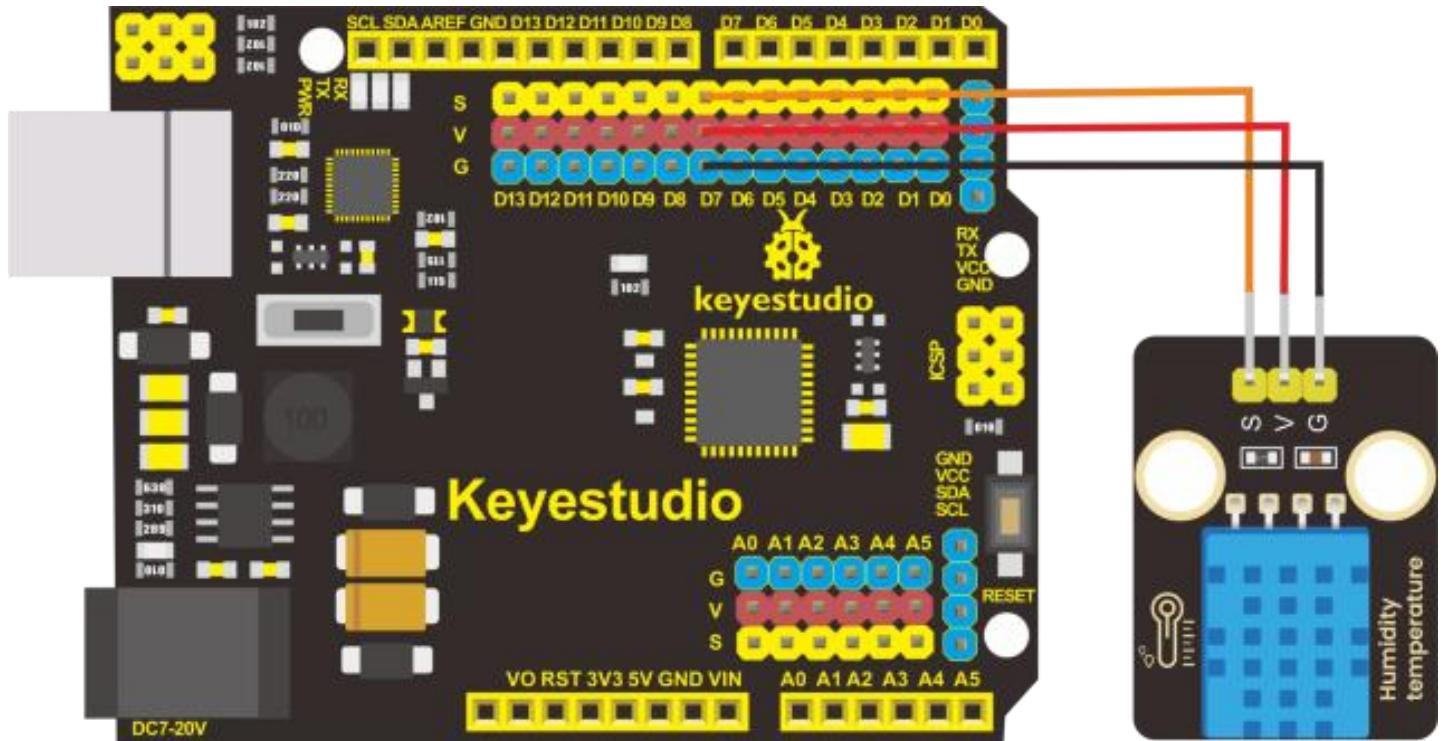

Note: In order to avoid reverse connection, we recommend wiring according to the following method:

-The G pin of the module is connected to the G pin of UNO with a black wire;

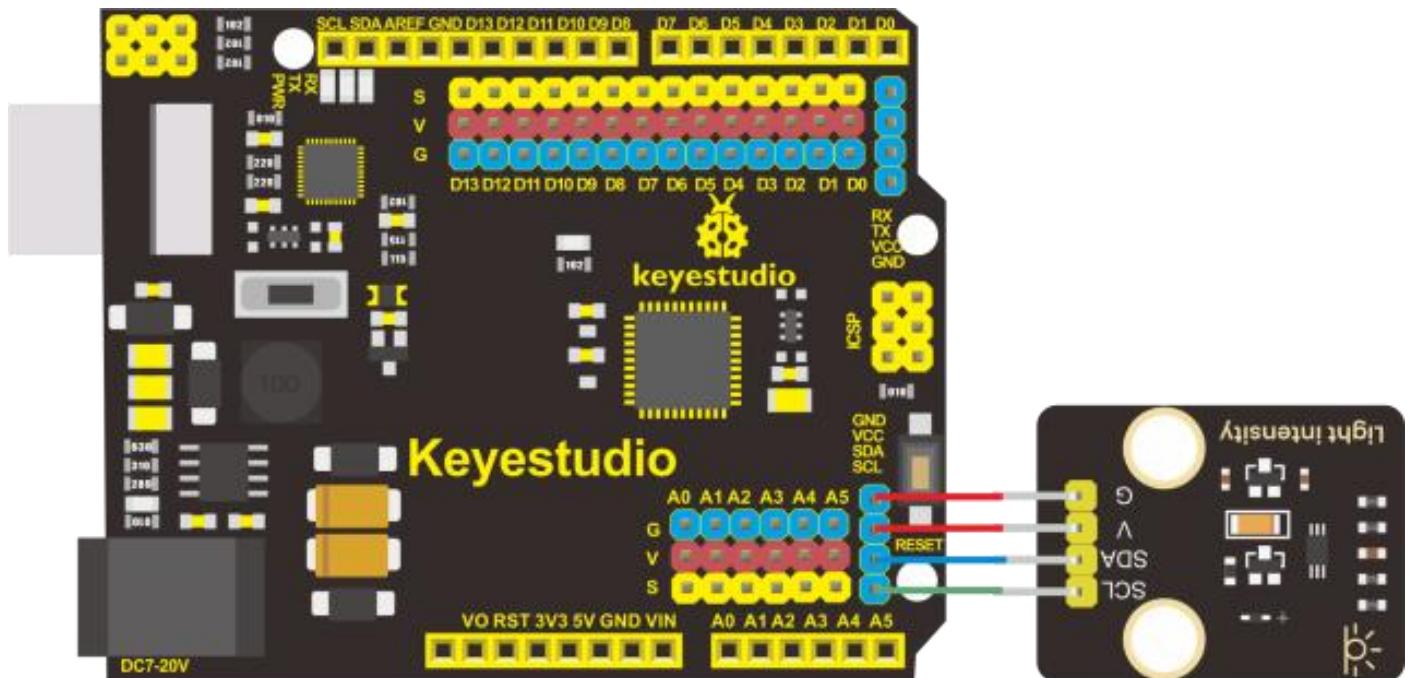

-The V pin of the module is connected to the V pin of UNO with a red wire;

-The S pin of the module is connected to the S pin of UNO with a orange wire.

As shown in the way the dht11 temperature and humidity sensor is connected to the UNO board.

3)Finally, connect the bh1750 digital light intensity module to the UNO board.

Lesson 11: Solar Panel Device with Multiply Functions

The assembled solar panel device is ready!

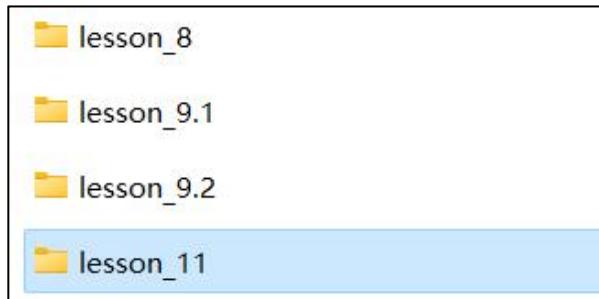

In the previous lessons, we only studied the function and working principle of a certain electronic part individually, and tested whether it can work normally.

Now we have them working together to build a solar panel device with multiple functions.

Keep the 18650 battery charged enough as it will be needed to power two servos, an LCD display, four light sensors, a DHT11 sensor and button module.

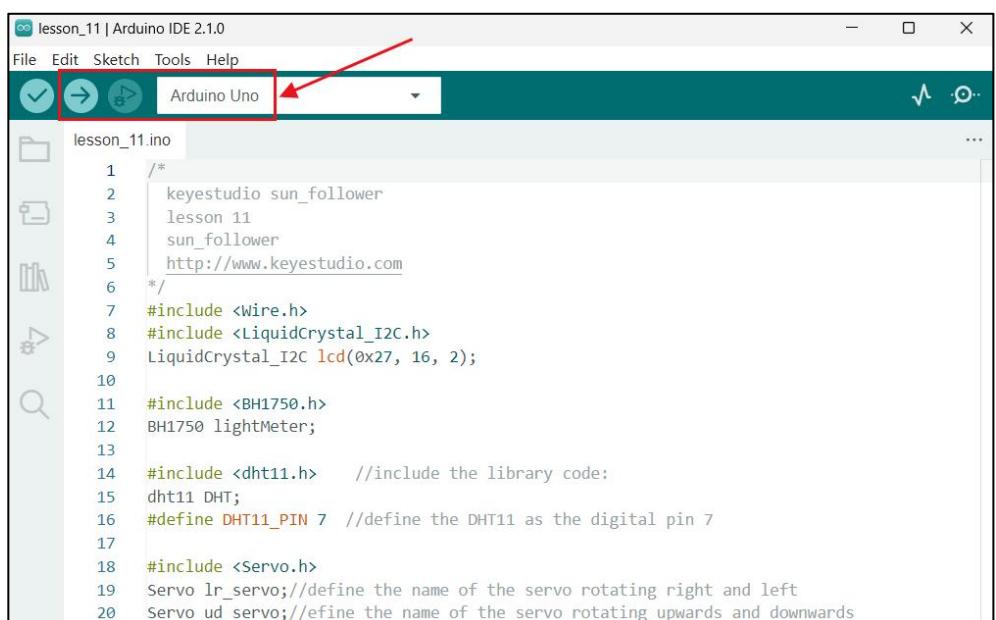

1. Connect the control board to the computer with the usb cable.

2. Open the INO file inside the **lesson_11** folder with Arduino IDE.

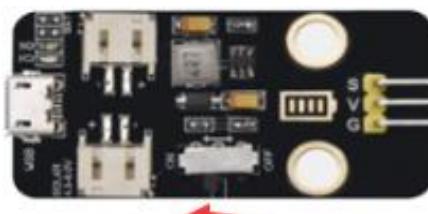

3. Click the board selector or tool menu to select "**Arduino UNO**" and **COM-XX**

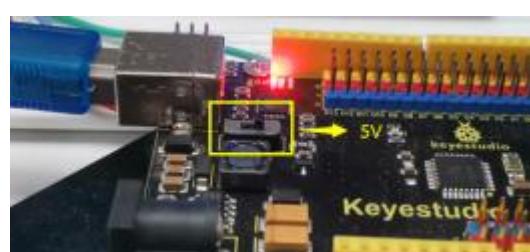

4. Click upload >>>done uploading.

After the code is uploaded successfully, turn on the power switch of the charging module and press the power switch of the control board to 5V.

Turn the power switch on

The servo will rotate to the initial angle. When the ambient light sensor detects changes in light intensity, servos rotate the solar panel to the position where the light is the strongest and

LCD1602 shows the value of the light intensity and temperature and humidity detected by the BH1750 and XHT11 respectively.

If you feel that the solar panel rotates too slowly or the solar panel shakes, you can adjust the rotation speed of the servo through the button module.

For example, within the specified time, the servo rotates 1° each time. After pressing the button, the servo will rotate 2° each time within the same time.

Press it again and the servo will rotate 3° each time in the same time. By analogy, the servo can be adjusted to rotate up to 5° each time in the same time.

"byte m_speed = 10"

You can also change this code to set the delay time to adjust the speed of the servo; the longer the time, the smaller the speed.
